Letter No: (Thittaw) 3(2) 16 (Gagyi) (3444/2017)

Date: 25<sup>th</sup> October 2017

To :

Dawei Special Economic Zone Management Committee

Subject: Reporting on approval of re-submitted ESIA Report on Initial Township Project to be implemented in Dawei Special Economic Zone by Dawei Residence Co., Ltd

Reference: Letter of Dawei Special Economic Zone Management Committee, dated 1<sup>st</sup> June 2016, Letter No. HtaWa-16/DSEZ/2017 (186)

In the matter of the submission of report on Environmental Impact Assessment (EIA) on constructing Initial Township Project by Dawei Residence Co., Ltd. in Dawei Special Economic Zone, we found that the assessment report is in compliance with paragraph 63 of the Environmental Assessment Procedure and thus we approve the report and in response that we recommend following to be complied with:

- (a) The proponent shall ensure that all environmental management procedures, project-related undertakings and regulations are implemented, and that all contractors and sub-contractors which carry out the project activities on behalf of the proponent to fully comply with applicable law, regulations, this procedure, environmental management programmes and rules
- (b) The proponent shall carry out the programmes exactly as what is proposed in the approved environmental impact assessment report, including methods to minimize impact on environment, social and health which may be caused by the proposed project, arrangement for environmental programmes, related sub-programmes, methods of supervision
- (c) The proponent shall keep sufficient fund for monitoring programmes and sub-programs of environmental management and form the committees to implement them.
- (d) The proponent shall publicize the approved environmental assessment report and post on the respective company's website to obtain public recommendations.

- (e) The project proponent shall continuously discuss with the stakeholders and incorporate their recommendations in the plan
- (f) The project proponent shall comply with the following standards:
- (aa) In operating the proposed activities, to comply with the prescription of the National Environmental Quality (Emission) Guideline and Standard of Smoke Emission
  - (bb) In operating the project, to comply with IFC EHS General Guideline in terms of the employees management.
  - (cc) To comply with the undertaking as stated in the report to comply with ISO 14001 Environmental Management System (EMS) which is the international standard
- (g) With regard to emergency response plan, although it is provided in the report, the project proponent shall revise the plan as necessary according to changing environmental situation and submit the same to the Management Committee and this Ministry
- (h) With regard to community support programme, the project proponent shall, during pre-construction period, construction period, operation period and closing period, provide support such as public health, public roads, electricity, water supply and other infrastructure, and public safety programmes; and to include the results in the monitoring report and submit the same to Dawei Special Economic Zone Management Committee and this Ministry.
- (i) For the project proponent only held one stakeholders meeting in 2015, and the fulfilment of the requests of stakeholders are not clearly mentioned in the report, therefore, the project proponent shall hold another stakeholders meeting and include the results of (1) the plan for environment and social development in the Initial Township Project in the Dawei Special Economic Zone, (2) continual discussion with the stakeholders, (3) implementation of stakeholders' recommendations from continual discussion, in the in the monitoring report and submit the same to Dawei Special Economic Zone Management Committee and this Ministry.
- (j) The project proponent shall comply with the undertakings contained in the Environmental Impact Assessment Report. In addition, during pre-construction period, construction period, operation period and closing period, it shall carry out without fail monitoring and scrutinising environmental conservation and social impacts, and reporting to relevant departments. Besides, in carrying out activities relating to environment and community, the project proponent shall continuously conduct public consultation and negotiate for transparency and to include the results

စီမံကိန်းပိုင်ရှင်သည်-

- (က) သီးသန့်မီးသတ်တပ်ဖွဲ့ ဖွဲ့စည်းပါမည်။ (ပုဒ်မ ၂၅ (က) အရ)
- (ခ) မီးဘေးလုံခြုံရေးဆိုင်ရာ ပစ္စည်းများကို ထားရှိပါမည်။ (ပုဒ်မ ၂၅ (ခ) အရ)

**၁၁။ မော်တော်ယာဉ် ဥပဒေ(၂၀၁၅) နှင့် မော်တော်ယာဉ်နည်းဥပဒေများ(၁၉၈၇)**

စီမံကိန်းပိုင်ရှင်သည်-

လေထုညစ်ညမ်းစေခြင်း၊ အသံဆူညံစေခြင်းနှင့် အသက်အန္တရာယ် လုံခြုံစိတ်ချမှုတို့နှင့် သက်ဆိုင်သည့် ဤဥပဒေနှင့် နည်းဥပဒေများပါ ပြဋ္ဌာန်းချက်များကို လိုက်နာဆောင်ရွက် ပါမည်။

**၁၂။ မြန်မာ့အာမခံလုပ်ငန်းဥပဒေ(၁၉၉၃)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) ကိုယ်ပိုင်ယာဉ်များ သုံးစွဲမည်ဆိုပါက လူထိခိုက်မှုဆိုင်ရာ အာမခံ ထားရှိပါမည်။ (ပုဒ်မ ၁၅ အရ)
- (ခ) ပတ်ဝန်းကျင်ကို ထိခိုက်စေခြင်းနှင့် ပြည်သူ့လူထုကို နစ်နာစေခြင်းဖြစ်ပေါ်လျှင် ယင်းအထွေထွေ ဆုံးရှုံးနစ်နာမှုကို ပေးလျော်နိုင်ရန် ထားရှိရမည့် အာမခံကို ထားရှိပါမည်။ (ပုဒ်မ ၁၆ အရ)

**၁၃။ အလုပ်သမားအဖွဲ့အစည်းဥပဒေ(၂၀၁၁)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) အလုပ်သမား ဥပဒေနှင့် မညီဘဲ အလုပ်ထုတ်ခံရသည့် အလုပ်သမားကို ပြန်လည် အလုပ်ခန့်ထားရန် တောင်းဆိုသည်ကို ခွင့်ပြုပါမည်။ (ပုဒ်မ ၁၈အရ)
- (ခ) အလုပ်ရှင်နှင့် အလုပ်သမားအကြား အငြင်းပွားမှုကို ညှိနှိုင်းဖျန်ဖြေရေးအဖွဲ့က ဖြေရှင်းရာတွင် ယင်းအဖွဲ့သို့ အလုပ်သမားကိုယ်စားလှယ် စေလွှတ်ခြင်းကို ခွင့်ပြုပါမည်။ (ပုဒ်မ ၁၉ အရ)
- (ဂ) အလုပ်သမားဥပဒေများပါ အလုပ်သမားအခွင့်အရေး သို့မဟုတ် အကျိုးစီးပွားနှင့် စပ်လျဉ်း၍ အစိုးရ၊ အလုပ်ရှင်နှင့် တောင်းဆိုသူ အလုပ်သမားတို့ ဆွေးနွေးရာတွင် အလုပ်သမား အဖွဲ့အစည်း၏ ကိုယ်စားလှယ်ကို ပါဝင်ဆွေးနွေးခွင့်ပြုပါမည်။ (ပုဒ်မ ၂၀ အရ)
- (ဃ) အလုပ်သမား ဥပဒေများနှင့်အညီ အလုပ်သမားများ၏ စုပေါင်းအရေးဆိုမှုများကို ဖြေရှင်းရာတွင် အလုပ်သမားအဖွဲ့အစည်းကို ပါဝင်ဆောင်ရွက်ခွင့်ပြုပါမည်။ (ပုဒ်မ ၂၁ အရ)

- (င) အလုပ်သမား အဖွဲ့အစည်းက သက်ဆိုင်ရာ အလုပ်သမား အဖွဲ့ချုပ်က ချမှတ်ထားသော လုပ်ထုံးလုပ်နည်းများ၊ စည်းမျဉ်းစည်းကမ်း၊ ညွှန်ကြားချက်များနှင့်အညီ အစည်းအဝေးများပြုလုပ်ခြင်း၊ သပိတ်မှောက်ခြင်းတို့ကို ခွင့်ပြုပါမည်။ (ပုဒ်မ ၂၂ အရ)

**၁၄။ အလုပ်သမားရေးရာအငြင်းပွားမှုဖြေရှင်းရေးဥပဒေ(၂၀၁၂)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) တောင်းဆို တိုင်ကြားချက်နှင့် စပ်လျဉ်း၍ သတ်မှတ်ကာလအတွင်း ဆွေးနွေး ညှိနှိုင်းဖြေရှင်းရာတွင် ပျက်ကွက်မည် မဟုတ်ပါ။ (ပုဒ်မ ၃၈ အရ)
- (ခ) ခုံသမာဓိအဖွဲ့ သို့မဟုတ် ခုံအဖွဲ့က အငြင်းပွားမှု စစ်ဆေးနေစဉ် ကာလအတွင်း ထိုအငြင်းပွားမှု မစီမံ ချမှတ်ထားသော အလုပ်သမားများနှင့် သက်ဆိုင်သည့် စည်းကမ်းများကို အလုပ်သမားများ၏ အကျိုးစီးပွားထိခိုက်စေရန် ရုတ်တရက် ပြောင်းလဲခြင်း မပြုပါ။ (ပုဒ်မ ၃၉ အရ)
- (ဂ) အငြင်းပွားမှု တစ်ခုနှင့် စပ်လျဉ်း၍ ဤဥပဒေနှင့်အညီ ဆွေးနွေးညှိနှိုင်းခြင်း၊ ဖျန်ဖြေခြင်းနှင့် ခုံသမာဓိအဖွဲ့ဖြင့် ဆုံးဖြတ်ခြင်းတို့ကို မပြုဘဲ အလုပ်မထုတ်ပါ။ (ပုဒ်မ ၄၀ အရ)
- (ဃ) ခုံသမာဓိ သို့မဟုတ် ခုံအဖွဲ့က ပုဒ်မ ၅၁ အရ ဆုံးဖြတ်သည့် လျော်ကြေးငွေကို ပေးဆောင်ပါမည်။ (ပုဒ်မ ၅၁ အရ)

**၁၅။ အလုပ်အကိုင်နှင့် ကျွမ်းကျင်မှုဖွံ့ဖြိုးတိုးတတ်ရေး ဥပဒေ(၂၀၁၃)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) အလုပ်သမားခန့်ထားရာတွင် ဤဥပဒေ ပုဒ်မ ၅ ပါ ပြဋ္ဌာန်းချက်များနှင့်အညီ စာချုပ်ချုပ်ဆို၍ ခန့်ထားပါမည်။ (ပုဒ်မ ၅၅အရ)
- (ခ) ခန့်ထားရန် လျာထားသော အလုပ်သမားနှင့် လုပ်ငန်း၌ လုပ်ကိုင်လျက်ရှိသော အလုပ်သမားများ၏ အလုပ်အကိုင်ဆိုင်ရာ ကျွမ်းကျင်မှုအဆင့် မြင့်မားစေရန် လေ့ကျင့်ရေး အစီအစဉ်များကို လုပ်ငန်းလိုအပ်ချက်အရ ကျွမ်းကျင်မှု ဖွံ့ဖြိုးတိုးတက်ရေးအဖွဲ့၏ မူဝါဒနှင့်အညီ ဆောင်ရွက်ပါမည်။ (ပုဒ်မ ၁၄ အရ)
- (ဂ) မိမိ၏ လုပ်ငန်း၌ အလုပ်သမားကြီးကြပ်သူအဆင့်နှင့် ယင်းအဆင့်အောက်ရှိ အလုပ်သမားများကို ပေးချေရသည့် စုစုပေါင်းလုပ်ခ၊ လစာ၏ ၀.၅ ရာခိုင်နှုန်း အောက် မနည်းသောငွေကို ရန်ပုံငွေသို့ ထည့်ဝင်ခြင်းအဖြစ် လစဉ်ပေးသွင်းပါမည်။ ယင်းထည့်ဝင်ကြေးအတွက် အလုပ်သမားများ၏ လုပ်ခ၊ လစာမှ ဖြတ်တောက်ခြင်းမပြုပါ။ (ပုဒ်မ ၃၀အရ)

**၁၆။ ၂၀၁၃ခုနှစ်၊ အနည်းဆုံးအခကြေးငွေဥပဒေ**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) ပုဒ်မ ၁၂ ပါ သတ်မှတ်ချက်များနှင့်အညီ အခကြေးငွေ ပေးချေပါမည်။ (ပုဒ်မ၁၂အရ)
- (ခ) သတ်မှတ်ထားသော အနည်းဆုံးအခကြေးငွေ နှုန်းထားများကို အလုပ်သမား များကို အသိပေးမည့်အပြင် လုပ်ငန်းခွင်တွင် မြင်နိုင်စေရန် ကြော်ငြာထားပါမည်။ (ပုဒ်မ၁၃ (က)အရ)
- (ဂ) ပုဒ်မ ၁၃ ပါ ပြုစုရမည့် စာရင်းဇယားနှင့် စာတမ်းအမှတ်အသားများကို ပြုစုခြင်း၊ သက်ဆိုင်ရာ ဦးစီးဌာနသို့ သတ်မှတ်ချက်များနှင့်အညီ အစီရင်ခံခြင်း၊ ယင်းတို့ကို တောင်းခံသည့်အခါ တင်ပြခြင်းတို့ ပြုပါမည်။ (ပုဒ်မ ၁၃ (ခ)၊ (ဂ)၊ (ဃ) တို့အရ)
- (ဃ) ပုဒ်မ ၁၃ (င)နှင့် ပုဒ်မ ၁၈ အရ စစ်ဆေးရေးအရာရှိများက လာရောက် စစ်ဆေးခြင်းကို ခွင့်ပြုပါမည်။ (ပုဒ်မ ၁၃ (င)နှင့် ၁၈ အရ)
- (င) အလုပ်သမား ဖျားနာ၍ အလုပ်မလုပ်နိုင်သည့်အခါ ဆေးကုသရန် သတ်မှတ်ချက်များနှင့်အညီ နားခွင့်ပေးပါမည်။ (ပုဒ်မ ၁၃ (စ) အရ)
- (စ) အလုပ်သမားများ၏ မိသားစုဝင် သို့မဟုတ် မိဘနားရေးဖြစ်သည့်အခါ အနည်းဆုံး အခကြေးငွေမှာ ဖြတ်တောက်ခြင်းမပြုဘဲ သတ်မှတ်ချက်များနှင့် အလုပ်နားခွင့် ပြုပါမည်။ (ပုဒ်မ ၁၃ (ဆ) အရ)

**၁၇။ ၂၀၁၆ခုနှစ်၊ အခကြေးငွေပေးချေရေးဥပဒေ**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) အခကြေးငွေ ပေးချေခြင်းနှင့် စပ်လျဉ်း၍ ပုဒ်မ ၃ နှင့် ပုဒ်မ ၄ ပါပြဋ္ဌာန်းချက် များနှင့်အညီ ပေးချေပါမည်။ (ပုဒ်မ၃ နှင့် ၄အရ)
- (ခ) သဘာဝဘေးအန္တရာယ်အပါပဝင် မမျှော်လင့်သော ထူးခြားသည့်အခြေအနေ ပေါ်ပေါက်ပါက အခကြေးငွေ ပြောင်းလဲပေးချေလိုကြောင်းကို သက်ဆိုင်ရာ အလုပ်သမားများ၏ သဘောတူညီချက်ဖြင့် တင်ပြပါမည်။ (ပုဒ်မ၅အရ)
- (ဂ) အလုပ်သမားထံမှ နုတ်ယူရန် လိုအပ်သည့်ငွေကြေးနှင့် စပ်လျဉ်း၍ အခန်း (၃)ပါ ပြဋ္ဌာန်းချက်နှင့်အညီ လိုက်နာဆောင်ရွက်ပါမည်။ (အခန်း ၃ အရ)
- (ဃ) အချိန်ပို လုပ်ကိုင်ရသည့် အလုပ်သမားကို ဥပဒေက သတ်မှတ်သည့် နှုန်းထားအတိုင်း အချိန်ပိုလုပ်ခပေးပါမည်။ (ပုဒ်မ၁၄ အရ)

**၁၈။ အလုပ်သမားလျော်ကြေး အက်ဥပဒေ(၁၉၅၁)**

စီမံကိန်းပိုင်ရှင်သည် ရရှိသည့် ထိခိုက်နစ်နာမှု အမျိုးအစားအလိုက် ကိစ္စရပ်တစ်ခုချင်း အပေါ်တွင် ဤဥပဒေပါ ပြဋ္ဌာန်းချက်များနှင့်အညီ လျော်ကြေးငွေကို ပေးလျော်ပါမည်။

**၁၉။ ခွင့်နှင့် အလုပ်ပိတ်ရက်များ အက်ဥပဒေ(၁၉၅၁)**

စီမံကိန်းပိုင်ရှင်သည် ဤဥပဒေပါ ပြဋ္ဌာန်းချက်များနှင့်အညီ ခွင့်နှင့် အလုပ်ပိတ်ရက် များကို ခွင့်ပြုပါမည်။

**၂၀။ လူမှုဖူလုံရေးဥပဒေ(၂၀၁၂)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) သက်ဆိုင်ရာ လူမှုဖူလုံရေးရုံးတွင် မှတ်ပုံတင်ထားရှိပါမည်။ (ပုဒ်မ၁၁ (က)အရ)
- (ခ) ပုဒ်မ ၁၅၊ ပုဒ်မခွဲ (က)ပါကျန်းမာရေးနှင့် လူမှုရေး စောင့်ရှောက်မှု ရန်ပုံငွေ၊ အလုပ်လုပ်ကိုင်နိုင်စွမ်းမရှိမှု အကျိုးခံစားခွင့်၊ သက်ပြည့်အငြိမ်းစား အကျိုးခံစားခွင့်နှင့် ကျန်ရစ်သူ အကျိုးခံစားခွင့် ရန်ပုံငွေ၊ အလုပ်လက်မဲ့ အကျိုးခံစားခွင့် ရန်ပုံငွေနှင့် သတ်မှတ်ထားသော မထည့်မနေရ ထည့်ဝင်ရမည့် ရန်ပုံငွေများကို မှတ်ပုံတင်ထည့်ဝင်ပါမည်။ (ပုဒ်မ၁၅ (ခ) အရ)
- (ဂ) အလုပ်သမားက ပေးသွင်းရမည့် ထည့်ဝင်ကြေးကို ယင်း၏ လုပ်ခထဲမှ နုတ်ယူပြီး မိမိက ပေးသွင်းရမည့် ထည့်ဝင်ကြေး ငွေနှင့်အတူ သက်ဆိုင်ရာ လူမှုဖူလုံရေး ရန်ပုံငွေသို့ ပေးသွင်းပါမည်။ ထိုသို့ပေးသွင်းရသည့် ကုန်ကျစားရိတ်ကို မိမိက ကျခံပါမည်။ (ပုဒ်မ၁၈ (ခ) အရ)
- (ဃ) အလုပ်တွင် ထိခိုက်မှု အကျိုးခံစားခွင့် ရန်ပုံငွေသို့ သတ်မှတ်ထားသော ထည့်ဝင်ကြေးပေးပြီး အာမခံထားရှိပါမည်။ (ယင်းရန်ပုံငွေသည် အလုပ်သမား လျော်ကြေး အက်ဥပဒေပါ ပြဋ္ဌာန်းချက်များနှင့် သက်ဆိုင်ခြင်းမရှိကြောင်း သိရှိပါသည်။) (ပုဒ်မ၄၈ (ခ)နှင့် ၄၉ (က) တို့အရ)
- (င) ပုဒ်မ ၁၇ တွင် ဖော်ပြထားသည့် မှတ်တမ်းနှင့် စာရင်းများကို မှန်ကန်စွာပြုစုပြီး သက်ဆိုင်ရာ လူမှုဖူလုံရေးရုံးသို့ သတ်မှတ်ချက်များနှင့်အညီ တင်ပြပါမည်။ (ပုဒ်မ၇၅အရ)

**၂၁။ ရေနံအက်ဥပဒေ(၁၉၃၄)**

စီမံကိန်းပိုင်ရှင်သည် စီမံကိန်းအတွက် လိုအပ်သည့် လောင်စာဆီများကို တင်သွင်းခြင်း၊ သယ်ယူပို့ဆောင်ခြင်းနှင့်သိုလှောင်ခြင်းတို့အတွက် ပုဒ်မ ၃ အရ လိုအပ်သည့် လိုင်စင်ကို ရယူပါမည်။ ထို့ပြင် ယင်းလိုင်စင်ပါ စည်းကမ်းချက်များကိုလည်း လိုက်နာပါမည်။

**၂၂။ ရေနံနည်းဥပဒေများ(၁၉၃၇)**

စီမံကိန်းပိုင်ရှင်သည် စီမံကိန်းအတွက် လိုအပ်သည့် လောင်စာဆီများကို တင်သွင်းခြင်း၊ သယ်ယူပို့ဆောင်ခြင်းနှင့်သိုလှောင်ခြင်းတို့အတွက် နည်းဥပဒေများ အခန်း (၃) နှင့် (၄) ပါ သတ်မှတ်ပြဋ္ဌာန်းချက်များနှင့်အညီ လိုက်နာဆောင်ရွက်ပါမည်။ (အခန်း (၃)နှင့် (၄)အရ)

**၂၃။ ရေအရင်းအမြစ်နှင့် မြစ်၊ ချောင်းများထိန်းသိမ်းရေး ဥပဒေ(၂၀၀၆)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) ရေအရင်းအမြစ်နှင့်မြစ်၊ ချောင်းများထိခိုက်ပျက်စီးစေရန် ရည်ရွယ်၍ တစ်စုံတစ်ရာပြုလုပ်ခြင်း မပြုပ။ (ပုဒ်မ ၈ (က) အရ)
- (ခ) ဦးစီးဌာနက မြစ်၊ ချောင်းအတွင်း ရေထုညစ်ညမ်းမှု မဖြစ်ပေါ်စေရေးနှင့် ရေလမ်းကြောင်းမပြောင်းလဲစေရေးအတွက် သတ်မှတ်ထားသော စည်းကမ်းချက် များကို ဖောက်ဖျက်ခြင်းမပြုပါ။ (ပုဒ်မ ၂၄ (က)အရ)

**၂၄။ ရေချိုငါးလုပ်ငန်း ဥပဒေ (၁၉၉၁)**

စီမံကိန်းပိုင်ရှင်သည်ရေချိုငါးလုပ်ငန်း ရေပြင်အတွင်း ရေထုညစ်ညမ်းစေခြင်းနှင့် ငါးနှင့် အခြားရေးနေသတ္တဝါများကို နှောက်ယှက်ခြင်း မပြုပါ။ (ပုဒ်မ ၄၀ အရ)

**၂၅။ မြန်မာ့ပင်လယ်ငါး လုပ်ငန်းဥပဒေ (၁၉၉၀)**

စီမံကိန်းပိုင်ရှင်သည် ငါး၊ အခြားရေနေသတ္တဝါတို့ကို အနှောင့်အယှက်ဖြစ်စေရန် သို့မဟုတ် ရေထုကို ညစ်ငြမ်းစေရန် သက်ရှိရေသတ္တဝါကို ဖြစ်စေ၊ အရာဝတ္ထုပစ္စည်းတစ်ခုခုကို ဖြစ်စေ၊ မြန်မာ့ ပင်လယ်ငါးလုပ်ငန်း ရေပြင်တွင် စွန့်ပစ်ခြင်းမပြုပါ။ (ပုဒ်မ ၃၉ အရ)

**၂၆။ ယဉ်ကျေးမှုအမွေအနှစ်ဒေသများ ကာကွယ်ထိန်းသိမ်းရေး ဥပဒေ (၁၉၉၈)**

စီမံကိန်းဧရိယာသည် ရှေးဟောင်းအမွေအနှစ် ဒေသအတွင်း ကျရောက်ပါက စီမံကိန်းပိုင်ရှင်သည် ပုဒ်မ ၁၃ နှင့် ၁၅ တို့ပါ ပြဋ္ဌာန်းချက်များနှင့်အညီ လိုက်နာဆောင်ရွက် ပါမည်။

**၂၇။ ရှေးဟောင်း ဝတ္ထုပစ္စည်းများ ကာကွယ်ထိန်းသိမ်းရေး ဥပဒေ (၂၀၁၅)**

စီမံကိန်းပိုင်ရှင်သည် မိမိ၏ စီမံကိန်း ဧရိယာအတွင်း ရှေးဟောင်းဝတ္ထုပစ္စည်းကို တွေ့ရှိပါက အနီးဆုံးရပ်ကွက် သို့မဟုတ် ကျေးရွာအုပ်စု အုပ်ချုပ်ရေးမှူးထံ အကြောင်းကြားပါမည်။ (ပုဒ်မ ၁၂ အရ)

**၂၈။ ရှေးဟောင်းအဆောက်အအုံများ ကာကွယ်ထိန်းသိမ်းရေး ဥပဒေ (၂၀၁၅)**

စီမံကိန်းပိုင်ရှင်သည်-

- (က) စီမံကိန်း နယ်နိမိတ်အတွင်း မြေအောက် သို့မဟုတ် မြေပေါ်တွင် ရှေးဟောင်း အဆောက်အအုံကို တွေ့ရှိပါက အနီးဆုံးရပ်ကွက် သို့မဟုတ် ကျေးရွာအုပ်စု အုပ်ချုပ်ရေးမှူးထံ အကြောင်းကြားပါမည်။ (ပုဒ်မ ၁၂အရ)
- (ခ) စီမံကိန်း ဧရိယာသည် ရှေးဟောင်းအဆောက်အအုံ ဧရိယာအဖြစ် သတ်မှတ်သည့် ဧရိယာအတွင်း ကျရောက်ပါက ရှေးဟောင်းသုတေသန ဦးစီးဌာန၏ ကြိုတင်ခွင့် ပြုချက်ကို ရယူပါမည်။ (ပုဒ်မ ၁၅ အရ)

- (ဂ) ရှေးဟောင်းအဆောက်အအုံ နယ်နိမိတ်အတွင်း အစိုင်အခဲများ စွန့်ပစ်ခြင်းနှင့် ဓာတုပစ္စည်းများ စွန့်ပစ်မည်ဆိုပါက ရှေးဟောင်းသုတေသန ဦးစီးဌာန၏ ကြိုတင်ခွင့် ပြုချက်ကို ရယူပါမည်။ (ပုဒ်မ ၂၀ (စ) အရ)

**၂၉။ သစ်တောဥပဒေ (၁၉၉၂ )**

စီမံကိန်းပိုင်ရှင်သည် သစ်တောနယ်မြေ သို့မဟုတ် သစ်တောဖုံးလွှမ်းသော နယ်မြေတွင် စီမံကိန်းကို ဆောင်ရွက်ရမည်ဖြစ်ပါက သယံဇာတနှင့် သဘာဝပတ်ဝန်းကျင်ထိန်းသိမ်းရေး ဝန်ကြီးဌာန၏ ခွင့်ပြုချက်ရယူပြီးမှ ဆောင်ရွက်ပါမည်။ (ပုဒ်မ ၁၂ (က) အရ)

**၃၀။ မြန်မာ့အထူးစီးပွားရေးဇုန်ဥပဒေ (၂၀၁၄)**

စီမံကိန်းပိုင်ရှင်သည် -

- (က) စီမံခန့်ခွဲမှုကော်မတီက အမိန့်ကြော်ငြာစာ၊ အမိန့်၊ ညွှန်ကြားချက်နှင့် လုပ်ထုံးလုပ်နည်း များဖြင့် သတ်မှတ်ပေးသည့် လိုက်နာရမည့် သတ်မှတ်ချက်များကို လိုက်နာဆောင်ရွက်ပါမည်။ (ပုဒ်မ ၁၁(စ) အရ)
- (ခ) သဘာဝပတ်ဝန်းကျင် ထိန်းသိမ်းကာကွယ်ရေးအတွက် စီမံခန့်ခွဲမှုကော်မတီ၏ တည်ဆဲ ဥပဒေများနှင့်အညီ ကြီးကြပ်ကွပ်ကဲခြင်းကို လိုက်နာဆောင်ရွက်ပါမည်။ (ပုဒ်မ ၁၁(တ) အရ)

26.	Environmental Management and Monitoring Plans	The Project commits to develop and implement all the updated EMPs and EMoPs during construction phase, operation phase and decommissioning phase.
27.	Environmental Monitoring Report	<p>The Project commits to report the results of realizing infrastructure such as public health programme, road for the locals, electricity, water supply etc. and safety programme during the project development period covering construction, operation and decommissioning in the Monitoring Report and then submit to DSEZMC and MONREC.</p> <p>The Project commits to keep fund for monitoring programmes and sub-programs of environmental management and form the committees to implement them.</p> <p>The Project commits to submit the Monitoring Reports every 6 months to MONREC for publishing for public awareness.</p>

## Project Key Commitments For Initial Township Project

No.	Issues	Commitments
28.	Contractors/Sub-Contractors	The Project commits to fully implement the EMP, all undertakings, terms and condition and ensure that all developer, contract and sub-contractors fully comply with relevant laws, regulations, procedures, EMP and all terms and conditions.
<b>CHAPTER 9 PUBLIC CONSULTATION AND DISCLOSURE</b>		
29.	Public Consultation	The Project commits to conduct public consultation and negotiate with the local community continuously for improvement of environmental and social conditions, realization and outcomes in the Monitoring Reports and then submit to the DSEZMC and the MONREC.
		The Project commits to continuously discuss with the stakeholders and incorporate their recommendations in the plan.
30.	Information Dissemination	The Project commits to publish the environmental impact assessment report.
31.	Grievance Redress	The Project commits to establish grievance organization and implement the grievance procedures in order to receive and responses to grievances in relating feedback or concerns of the locals / PAPs.

### Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
Erosion and Sedimentation Control	<p>CC shall prepare an <i>Erosion and Sediment Control Plan</i> for construction activities and submit to DRC for approval prior to commencement of construction activities in the area. The plan shall have the following components:</p> <ul style="list-style-type: none"> <li>An assessment of the potential for contamination of natural waterways. Basic principles include the size of the disturbed area, site drainage, and waterways receiving storm water from the disturbed area;</li> <li>Plans for water management during construction shall be established and include adequate drainage system to manage runoff from 2-year ARI storm flow;</li> <li>Sedimentation controls shall be implemented in the form of silt trap fences and sedimentation basins where appropriate, and all runoff from the disturbed area shall be directed to the sediment controls;</li> <li>Measures to be taken to collect, store and treat storm water prior to discharge from the site considering options for water re-use onsite;</li> <li>Management of material storage area - Stockpile and spoil disposal area shall not be located on drainage line and;</li> <li>Control of erosion and sedimentation shall be constructed progressively prior to commencement of each stage of earthworks until the permanent protection is established.</li> </ul>	<ul style="list-style-type: none"> <li>Inspect construction area every 6 months for the following: <ul style="list-style-type: none"> <li>Erosion and sediment control are in place prior to wet season</li> <li>Drainage system and sediment controls are functional during wet season</li> <li>Sediment basins have a capacity of reducing the suspended solid from storm water by 50%</li> </ul> </li> <li>Monitor water quality every 6 months for Total Suspended Solid in 2 locations; upstream and downstream of the entry points of surface water runoff from construction area.</li> <li>Monitor sediment quality every 6 months following: <ul style="list-style-type: none"> <li>9+1 phase monitor 2 sampling stations (TS-SW02 and TS-SW03)</li> <li>Full phase monitor 6 sampling stations in Figure 8.2-1</li> </ul> </li> </ul>	CC with DRC's approval
Surface Water Quality and Aquatic Biology	<ul style="list-style-type: none"> <li>Prepared and implement the measures for erosion and sedimentation control, waste management, and construction work camp.</li> <li>Release of oil and grease from workshop facilities is prohibited. Used oil need to be stored separately and managed as per the <i>Waste Management Plan</i>.</li> <li>Stock yards; gasoline, oil, lubricant and hydraulic oil storage areas; and machines/vehicles cleaning areas should be located at least 100 meter away from natural waterways.</li> <li>Used water shall be treated and disinfected before discharge into natural drainage.</li> </ul>	<ul style="list-style-type: none"> <li>Monitor every 6 months before and after rainy season through the construction period or at least for 3 years of all parameters in Table 8.2-1 and analysis methods as indicated in Table 8.2-1.</li> <li>9+1 phase monitor 2 sampling stations (TS-SW02 and TS-SW03).</li> <li>Full phase monitor 6 sampling stations as shown in Figure 8.2-1.</li> </ul>	CC with approval and under DRC's supervision

## LIST OF ABBREVIATION

ADB	Asian Development Bank
AEC	Asian Economic Community
BAT	Best Available Technology
CA	Concession Agreement
CB	Central Body
CC	Construction Contractor
CEMP	Construction phase Environmental Management Plan
CERMP	Construction phase Environmental Risk Management Plan
CO	Construction Phase
CSR	Corporation Social Responsibility
CWB	Central Working Body
DRC	Dawei Residence Company Limited
DSEZ	Dawei Special Economic Zone
DSEZMC	Dawei Special Economic Zone Management Committee
EC	Emergency Response Commander
ECC	Environmental Compliance Certificate
ECD	Environmental Conservation Department
ECL	Environmental Conservation Law
ECR	Environmental Conservation Rules
ED	Emergency Response Director
EHIA	Environmental and Health Impact Assessment
EHS	Environmental Health and Safety
EIA	Environmental Impact Assessment
EMoP	Environmental Monitoring Plan
EMP	Environmental Management Plan
EMS	Environmental Management System
EPC	Engineering Procurement and Construction
ERA	Environmental Risk Assessment
ERC	Emergency Response Center
ERP	Environmental Response Plan
ESIA	Environmental and Social Impact Assessment
FCS	Flood Controlling System
FFS	Fire Fighting System
FHWA	Federal Highway Administration
GIIP	Good International Industry Practice

---

IE	Initial Industrial Estate
IEC	International Engineering Consultant
IEE	Initial Environmental Examination
IFC	International Financial Cooperation
ITD	Italian Thai Development Company Limited
MAPDRR	Myanmar Action Plan on Disaster Risk Reduction
MIE	Myandawei Industrial Estate Company Limited
MOECAF	Ministry of Environmental Conservation And Forestry
MONREC	Ministry of Natural Resource and Environmental Conservation
MOU	Memorandum Of Understanding
MOU	Memorandum Of Understanding
NCEA	National Commission for Environmental Affairs
NECC	National Environmental Conservation Committee
NEQG	National Environmental Quality (Emissions) Guidelines
NESDB	National Economic and Social Development Board
OEMP	Operation phase Environmental Management Plan
OERMP	Operation phase Environmental Risk Management Plan
OHSA	Occupational Health and Safety Administration
OP	Operation Phase
PAH	Project Affected Households
PAP	Project Affected People
PCCD	Pollution Control and Cleaning Department
PIC	Person In Charge
PPAH	Pollution Prevention and Abatement Handbook
PPP	Public Private Participation
PRMP	Project Risk Management Plan
PS	Performance Standard
PTW	Permit To Work
REM	Resource and Environment Myanmar Limited
SEATEC	SEATEC Engineering Consultant
SEZ	Special Economic Zone
SIA	Social Impact Assessment
SWB	Support Working Body
TEAM	TEAM Group Consultant
TOR	Term Of Reference
UAE	United Analyst and Engineering Consultant
US EPA	US Environmental Protection Agency
WHO	World Health Organization

## LIST OF TECHNICAL ABBREVIATION

BOD	Biological Oxygen Demand
CC	Construction Contractor
CCTV	Closed-Circuit Television
CD	Chart Datum
CITES	Convention on International Trade in Endangered Species of Wild Fauna and Flora
CO	Carbon Monoxide
COD	Chemical Oxygen Demand
DO	Dissolve Oxygen
FCB	Fecal Coliform Bacteria
FOG	Fat Oil and Grease
GDS	Generator Docking Station
GHG	Green House Gases
GPS	Global Positioning System
HIV/AIDS	Human Immunodeficiency Virus/Acquired Immune Deficiency syndrome
HRT	Hydraulic Retention Time
ISO	International Organization for Standardization
IT	Information Technology
IUCN	Red Data List of Threatened Species
IVI	Important Value Index
L <sub>Aeq</sub>	Equivalent Continuous Noise Level
L <sub>Amax</sub>	Maximum value of A-weighted sound pressure Level
LNG	Liquefied Natural Gas
MHC	Methane Hydrocarbon
MR	Main Road
NMHC	Non Methane Hydrocarbon
PCE	Passenger Car Equivalent
PCU	Passenger Car Unit
PM	Particular Matter
SR	Secondary Road
TCB	Total Coliform Bacteria
TR	Tertiary Road
TSP	Total Suspended Particulate
TSS	Total Suspended Solid
VOC	Volatile Organic Compounds
VPN	Virtual Private Network

---

WTP	Water Treatment Plant
WWTP	Wastewater Treatment Plant
Tc	Retention Time
FCP	Fire Alarm Control Panel
ANN	Graphic Annunciator
F	Fire Alarm Manual Station
B	Fire Alarm Bell
FHC	Fire Hose Cabinet
FDC	Fire Department Connection
OTU	Onsite Treatment Unit
WGS	World Geodetic System
FSD	Foundation for Sustainable Development

## LIST OF UNITS

dB(A)	A-weight decibels (Noise level unit)
DWT	Deadweight Tonnage
Gbps	Gigabits Per Second
kV	Kilo Volts
KYATs	Myanmar Currency Unit
MVA	Mega Volts Amperes
MW	Mega Watt
NTU	Nephilometric Turbidity Unit
PCU	Passenger Car Unit
TEU	Twenty-Foot Equivalent Unit
UTM	Universal Transvers Mercator (Geographic Location)
CFU	Colony Forming Unit
KNU	Karen National Union
VA	Volt-Ampere

### LOCAL TOWNSHIP APARTMENT

The majority of residents in Local Township come from the workforce in Dawei Industrial Estate. The Local Township Typical Residential Design is a 4 storey apartment building with public area in the center.  
The design and construction are based on "ENERGY CONSERVATION CONCEPT": Building orientation, Cross ventilation and Sunlight stack in order to sustainably maintain the long-term well being of the tenants.

#### TYPICAL RESIDENTIAL BLOCK

Apartment units  
Commercial units

Every 2 apartments come with 1 canteen which capacitate 100 tenants a time. The Canteen has functions of kitchen, pantry and wash area in order to let the tenants use for daily meals and feasts.

Room Type: Studio  
Unit area: 20 sq. m.  
Tenants: 2 people / unit  
Apartment Type: 4 storey  
112 units / apartment  
224 tenants / apartment

There are Public Use Areas such as: Bathrooms, Laundry Yard for every floor. The layout is designed with the crisscross system in order to let each floor gain most of the sunlight during the day.

The walkway in the middle of the building is applied with the light & ventilation stack system. This system helps the corridor get more light and ventilation in order to reduce daily energy consumption. There is also a small green space in front of each unit for planting.

ထားဝယ်ကနဦးစက်မှုဇုန်၏ အထွေထွေအရေးပေါ် တုန့်ပြန်မှုအစီအစဉ်ကို အောက်ပါ အဆင့် (၃)ခု - အဆင့် (၁)၊ အဆင့် (၂)၊ အဆင့် (၃)ဟူ၍ ပိုင်းခြားထားပါသည်။

- **အဆင့် ၁** သည် အရေးပေါ် အသေးစားဖြစ်ပြီး လူနေအိမ်နှင့် စီးပွားရေးဆိုင်ရာ အဆောက်အဦများတွင် တွေ့ရပါသည်။ ဖြစ်ပွားမှုကို စက်ရုံရှိ အဖွဲ့ (သို့) စက်ရုံမှကိုယ်တိုင်ထိန်းချုပ်နိုင်ပါသည်။ သက်ရောက်မှုများကို ထိန်းချုပ်ရန်၊ လျော့နည်းစေရန် စက်ရုံက အကောင်းဆုံး ဆောင်ရွက်ရပါသည်။ ဖြစ်ပွားမှုကို ကနဦးစက်မှုဇုန် အရေးပေါ် တုန့်ပြန်မှုစင်တာ/ အဖွဲ့သို့ အကြောင်းကြားရပါမည်။
- **အဆင့် ၂** သည် အရေးပေါ် အလယ်အလတ်အဆင့်ဖြစ်ပြီး ကနဦးမြို့ပြအတွင်းရှိ အခြားလူနေအိမ်များသို့ ကူးနိုင်သော အခြေအနေရှိပါသည်။ သို့သော်လည်း အရေးပေါ်အခြေအနေကို စက်မှုဇုန်ကိုယ်တိုင် (သို့) အနီးအနားရှိ မြို့များမှ အကူအညီအားဖြင့် ထိန်းချုပ်နိုင်ပါသည်။ ကနဦးမြို့ပြသည် သက်ရောက်မှုများကို ထိန်းချုပ်ရန်၊ လျော့နည်းစေရန် စက်ရုံက အကောင်းဆုံး ဆောင်ရွက်ရမည်ဖြစ်ပြီး ကနဦးစက်မှုဇုန်ဝင်း၏ အာဏာပိုင် (သို့) PIC သို့ တင်ပြရပါမည်။
- **အဆင့် ၃** သည် အရေးပေါ်အကြီးစားအခြေအနေဖြစ်ပြီး အနီးအနား လူထုနှင့် ပတ်ဝန်းကျင်ကို ကူးနိုင်သော အခြေအနေရှိပါသည်။ သက်ရောက်မှုကို ထိန်းချုပ်ရန် လျော့နည်းစေရန် ပြင်ပနေရာ သုံးခုမှ အကူအညီနှင့် အနီးအနားရှိ အဖွဲ့အစည်းများ၏ ပူးပေါင်းဆောင်ရွက်မှု လိုအပ်ပါသည်။ ဖြစ်စဉ်ကို ကျေးရွာ (သို့) မြို့ပြအုပ်ချုပ်ရေးရုံး (သို့) မြန်မာတာဝန်ရှိဌာနများသို့ တင်ပြရပါမည်။

**၁.၃.၅.၂ မီးနှင့် ပေါက်ကွဲမှုများအတွက် အစီအစဉ်**

မီးငြိမ်းသတ်ခြင်း၊ ပေါက်ကွဲများတွင် အဆင့်သုံးဆင့်ပါဝင်ပါသည် (ကာကွယ်ခြင်း၊ တိမ်းရှောင်ခြင်းနှင့် ပြန်လည်ကုစားခြင်းအစီအစဉ်)။ အဆောက်အဦများ တည်ဆောက်ခြင်းနှင့် စီမံကိန်းအဆိုပြုသူသည် မြန်မာနိုင်ငံဥပဒေအရ သတ်မှတ်ထားသော ဆောင်ရွက်ချက်များကို လိုက်နာရပါမည်။ ကနဦးမြို့ပြသည် ဥပဒေတွင် ဖော်ပြထားသည့်အတိုင်း နှစ်စဉ် မီးဘေးအန္တရာယ် ကြိုတင်လေ့ကျင့်မှုများ၊ မီးကာကွယ်ခြင်းစနစ်များကို ဆောင်ရွက်ရပါမည်။ အရေးပေါ်အခြေအနေတွင် မီးနှင့် ပေါက်ကွဲမှုဖြစ်စဉ်များကို အရေးပေါ်မီးသတ်အဆင့်အရ ဆောင်ရွက်ရပါမည်။

**၁.၃.၅.၃ မုန်တိုင်းနှင့် ရေကြီးခြင်းများအတွက် အစီအစဉ်**

မုန်တိုင်းနှင့် ရေကြီးခြင်းများအတွက် အစီအစဉ်တွင် အခြေအနေသုံးရပ်ပါဝင်ပါသည်။ (ကာကွယ်ခြင်း၊ သတိပေးခြင်းနှင့် တိမ်းရှောင်ခြင်း၊ ပြန်လည်ကုစားရေးအစီအစဉ်)။ ရေနုတ်မြောင်းနှင့် ရေကြီးမှု ကာကွယ်ရေးစနစ်ကို မိုးရာသီမတိုင်မီ ပြင်ဆင်ထားရပါမည်။ ထို့ပြင် ရေကြီးခြင်း (သို့) မိုးရာသီ အတောအတွင်း အရေးပေါ် သတိပေးခြင်းများကိုလည်း လိုက်နာရန် လိုပါသည်။

**၁.၃.၆ လုပ်ငန်းခွင် ကျန်းမာရေးနှင့် ဘေးကင်းလုံခြုံရေး**

စီမံကိန်းသည် ISO14001, ISO9001 and OSHA 18001စံချိန်စံညွှန်းနှင့်အညီ စီမံကိန်းကို အကောင်အထည်ဖော်ဆောင်ရွက်ရန် ဘေးကင်းလုံခြုံသည့် ကျန်းမာရေးပတ်ဝန်းကျင် အဓိကအစီအစဉ်ကို ဖော်ဆောင်ခဲ့ပါသည်။ လုံခြုံရေးအစီအစဉ်တွင် ကျန်းမာရေးမူဝါဒနှင့် နည်းလမ်းများ (နှစ်စဉ်ကျန်းမာရေးစစ်ဆေးမှု၊ မူးရစ်ဆေးဝါးစစ်ဆေးမှု၊ ဆေးလိပ်သောက်ရန် သတ်မှတ်နေရာ၊ အဆင့်အတန်းရှိသော အလုပ်ခွင်နှင့် အစားအစာ) များအပါအဝင် အလုပ်စနစ်၊ တစ်ဦးချင်းကာကွယ်ရေးပစ္စည်းများ (PPE)၊ မြေသယ်ယူမှုစနစ်၊ ဆောက်လုပ်ရေးအတွင်း လုံခြုံမှု၊ ကာကွယ်ရေးများပါဝင်ပါသည်။ ၁၀နှစ်အတွင်း SHE master plan အသေးစိတ်ကို နောက်ဆက်တွဲ ၄-၄ တွင် ဖော်ပြထားပါသည်။

**၁.၃.၇ စီမံကိန်း ဆောင်ရွက်ချက်များ**

**၁.၃.၇.၁ စီမံကိန်းအဆင့်**

**(က) အဆောက်အဦးဆောက်လုပ်ခြင်း**

ကနဦးမြို့ဧရိယာနှင့် အဆောက်အဦးများ ပြင်ဆင်ခြင်းတွင် မြေသားရွေ့ပြောင်းခြင်း၊ အပင်များ ရှင်းလင်းခြင်းတို့ ပါဝင်ပါသည်။ ပန်ခြံဧရိယာများမှ လွဲ၍ လက်ရှိ ရှိနေသော အပင်များအားလုံးကို ရှင်းလင်းရပါမည်။ အသုံးပြုမှုနှင့် အဆောက်အဦးများ ဆောက်လုပ်ခြင်းသည် ကနဦးမြို့ ဖွံ့ဖြိုးတိုးတက်မှုအတွက် အဓိက ဆောင်ရွက်ချက်တစ်ခု ဖြစ်ပါသည်။ ဆောက်လုပ်ရေးတွင် လိုအပ်သော မြေသား၊ ကွန်ကရစ်အလုပ်များနှင့် လိုအပ်သော စက်၊ ကိရိယာများ ပါဝင်ပါသည်။

**(ခ) အလုပ်တဲများနှင့် အလုပ်နေရာများ ဆောက်လုပ်ခြင်း**

အလုပ်သမားများ နေထိုင်ရန်အတွက် အသုံးပြုသော အဓိက အလုပ်သမားတဲမှာ ကနဦးမြို့ ဆောက်လုပ်ခြင်းတွင် ပါဝင်ပြီး အဓိကလမ်းမကြီး တောင်ဘက် ၁၈ ကီလိုမီတာအကွာတွင် တည်ရှိပါသည်။ နေထိုင်ရာနေရာသည် အီတလီ- ထိုင်း PLC အားဖြင့် အများဆုံး အလုပ်သမား ၃၇၁ဦးအတွက် ဆောင်ရွက်ပေးနိုင်ရန် မျှော်မှန်းထားပါသည်။ ၂၅၆၀၀၀ စတုရန်းမီတာ ဧရိယာကို ဆောက်လုပ်ရေး လုပ်ငန်းများ ဆောင်ရွက်ရန် အတွက် အသုံးပြုပါမည်။ အိမ်ယာ၊ ကုန်ကြမ်းပစ္စည်းများ (စတီး၊ ဘိလပ်မြေနှင့် ဗိသုကာ ပစ္စည်းများ (တံခါးနှင့် ပြတင်းပေါက်))လိုအပ်ချက်ကို ဆောင်ရွက်နိုင်ရန်ထိုင်းနိုင်ငံမှ ကန်တင်ကားကြီးများဖြင့် ပို့ပို့ဆောင်ပါမည်။ အခြား ဆောက်လုပ်ရေး ကုန်ကြမ်းပစ္စည်းများ (ဥပမာ- သဲနှင့် ကျောက်)ကို DSEZ အနီးပတ်ဝန်းကျင် ဒေသမိုင်းတွင်းများမှ ထောက်ပံ့ပေးပါမည်။

**(ဂ) ဆောက်လုပ်ရေးပစ္စည်းများ သယ်ယူပို့ဆောင်ခြင်း**

ဆောက်လုပ်ရေးပစ္စည်းများကို ထိုင်းနိုင်ငံမှ သယ်ယူပြီး ကန်ချာပူရီနယ် မြန်မာ-ထိုင်း နယ်စပ်ကို ဖြတ်၍ သယ်ယူပါမည်။ မြို့တွင်း အဓိကလမ်းမကြီးကို အဆင့်မြှင့်တင်ပြီး ပစ္စည်းနှင့် စက်များသယ်ယူပို့ဆောင်ရ အဆင်ပြေစေရန် ချဲ့ထွင်သွားပါမည်။

**(ဃ) အလုပ်သမားတဲ မိလ္လာစနစ်**

အလုပ်သမားတဲများကို ထိုင်းနိုင်ငံ အင်ဂျင်နီယာအသင်း၏ စံချိန်စံညွှန်းနှင့်အညီ ဆောက်လုပ်ပါမည်။ အလုပ်သမားတဲအတွက် မိလ္လာစီမံခန့်ခွဲမှုကို ယာယီ ဆောက်လုပ်ရေး အလုပ်သမားတဲအတွက် နေရာချထားပုံနှင့် ထိုင်းနိုင်ငံ H.M the King's Patronage ၏ အင်ဂျင်နီယာအသင်းအားဖြင့် ထုတ်ပြန်ထားသော စံချိန်စံညွှန်းများအတိုင်း ဆောင်ရွက်သင့်ပါသည်။ (Wor Sor Tor. 1010-34 Standard)

**၁.၃.၇.၂ လုပ်ငန်းလည်ပတ်ဆဲအဆင့်**

စီမံကိန်းလည်ပတ်မှုသည် အပိုင်း ၄.၁.၁.၄ တွင် ဖော်ပြထားသည့်အတိုင်း အဆင့်များဖြင့် ဖြစ်ပါသည်။ လုပ်ငန်းလည်ပတ်ဆဲအဆင့်အတွင်း ဆောင်ရွက်မှုများမှာ အောက်ပါအတိုင်းဖြစ်ပါသည်။

**(က) နေထိုင်သူများ ဆောင်ရွက်ချက်**

စီမံကိန်းသည် အဆင့်အလိုက် ဖွံ့ဖြိုးလာမည်ဖြစ်သောကြောင့် မြို့ပြလူနေထိုင်ရာ ဧရိယာအတွင်း ပြည်သူ့ပန်းခြံများ အပါအဝင် နေထိုင်မှုနှင့် အားကစားနှင့် ပတ်သက်သော ဆောင်ရွက်မှုများကို ဇန် ၉ + ၁ ၏ ဧရိယာအနည်းငယ်တွင် စတင်ဆောင်ရွက်ပါမည်။ ထို့နောက် နေထိုင်သူများ ဆောင်ရွက်ချက်များသည် အဆင့် A, B, C နှင့် D အားဖြင့် မြို့အတွင်း လူဦးရေအရွယ်အစားအလိုက် ကျယ်ပြန့်လာပါမည်။

**(ခ) အဖွဲ့အစည်း ဆောင်ရွက်ချက်များ**

လက်လီအရောင်းဆိုင်များ ၎င်းတို့၏ လုပ်ငန်းများ စတင်ဆောင်ရွက်ချိန်တွင် အဖွဲ့အစည်းဆောင်ရွက်ချက်များစတင်ဆောင်ရွက်ပါမည်။ ၎င်းတွင် စီးပွားရေးဆိုင်ရာ ဧရိယာများတွင် စီးပွားရေးဆိုင်ရာ ခန်းမများပါဝင်ပြီး သင့်တော်သော အချိန်တွင် စတင်ဆောင်ရွက်ပါမည်။

**(ဂ) ယဉ်ကြောပိတ်ဆို့မှုနှင့် ဆက်သွယ်ပို့ဆောင်မှု**

လုပ်ငန်းလည်ပတ်စဉ်အတွင်း အဓိက သယ်ယူပို့ဆောင်ရေးသည် နေထိုင်သူများ၏ နေထိုင်ရာနေရာနှင့် အလုပ်သို့ သွားရာလမ်းကြောင်းအတိုင်း ဖြစ်ပါမည်။ (ဥပမာ- စက်မှုဇုန်နှင့် DSEZ ရှိ စက်ရုံများ)။ နေထိုင်သူများ၏ သွားလာရေးသည် မော်တော်ယာဉ်များဖြင့် ဖြစ်ပါမည်။ (ဥပမာ- ကား၊ ဆိုင်ကယ်)။ ပြည်သူပို့ဆောင်ရေးကားများ (သို့) ဘတ်စ်ကားများသည် မြို့တွင်းနှင့် အနီးအနားမြို့များ အပါအဝင် မြို့နှင့် DSEZ သို့ လမ်းကြောင်း ဖြစ်နိုင်ပါသည်။

မြို့တွင်း စီးပွားရေးများ ကျယ်ပြန့်လာသောအခါ ကုန်ပစ္စည်း ပို့ပို့ဆောင်ရွက်ရေးလုပ်ငန်းများ စတင်ပါမည်။ ကနဦးတွင် ယဉ်ကြောပိတ်ဆို့မှု သိပ်မဖြစ်သေးသော်လည်း ကုန်စည်များ ပို့ဆောင်ရေး ယဉ်များအတွက် လုံလောက်သော လမ်းစနစ် ရှိရပါမည်။ သို့သော် အခြားမြို့၏ ဆောက်လုပ်ရေးလုပ်ငန်းများသည် လုပ်ငန်းလည်ပတ်မှုနှင့် အပြိုင် ဆောင်ရွက်သောကြောင့် ဆောက်လုပ်ရေးပစ္စည်း ကိရိယာများ သယ်ယူပို့ဆောင်မှုသည် မြို့၏ အချို့လမ်းကြောင်းများကို မျှသုံးရပါမည်။

**(ဃ) ရေလွှမ်းမိုးမှု ကာကွယ်ခြင်း**

စီမံကိန်းသည် ခြောက်နာရီကြာ ရေလွှမ်းမိုးမှု ကာကွယ်နိုင်သော ရေလွှမ်းမိုးမှု ကာကွယ်ခြင်းစနစ်ကို ဒီဇိုင်းရေးဆွဲထားပါသည် (အပိုင်း ၄.၁.၄ တွင် အသေးစိတ်ကြည့်ရှုပါ)။ မိုးရေသည် မြို့၏ ရေနုတ်မြောင်းများ၊ တူးမြောင်းများကို ဖြတ်၍ စုဆောင်းပါမည်။ စနစ်ဆောင်ရွက်ချက်များတွင် မြောက်ဘက် ရေသိုလှောင်ကန်အတွက် ထားဝယ်မြစ်နှင့် တောင်ဘက် ရေသိုလှောင်ကန်အတွက် ခွန်ချောင်းမြစ်သို့ လျှော့သောရေများ စီးဆင်းနိုင်ရန် ရေစုတ်စက်များ ဂိတ်များဖြင့် ဆောင်ရွက်ထားပါသည်။

**(င) အပိုင်အခဲ စွန့်ပစ်ပစ္စည်း**

အစပိုင်းအဆင့်တွင် ညစ်ညမ်းမှုနည်းနိုင်သောကြောင့် စွန့်ပစ်ပစ္စည်း အနည်းငယ်သာ ထွက်ရှိပါမည်။ စွန့်ပစ်ပစ္စည်းကို အပိုင်း ၄.၁.၈.၁ တွင် ဖော်ပြထားသည့်နည်းအတိုင်း ကနဦးမြို့ပြ ဝန်ထမ်းများနှင့် ဝန်ဆောင်မှုအားဖြင့် ဆောင်ရွက်ပါမည်။ အန္တရယ်မရှိ စွန့်ပစ်ပစ္စည်းများကို စုဆောင်း၊ သိုလှောင်၊ ပို့ဆောင်ပြီး အနီးဆုံး စွန့်ပစ်နေရာ၌ စွန့်ပစ်ပါမည်။ အန္တရယ် ရှိ စွန့်ပစ်ပစ္စည်းများနှင့် ကူးစက်တတ်သော စွန့်ပစ်ပစ္စည်းများကို 200 drums (သို့) သင့်တော်သော ကွန်တိန်နာများတွင် သိုလှောင်ထားပြီး စွန့်ပစ်ရန်အတွက် ရန်ကုန်သို့ ပို့ဆောင်ပါမည်။

ထားဝယ် ကနဦး စက်မှုဇုန်၏ စွန့်ပစ်ပစ္စည်း စီမံခန့်ခွဲမှုစနစ်သည် စတင်ဆောင်ရွက်ပြီး စွန့်ပစ်ပစ္စည်းများကို အပိုင်း ၄.၁.၈ နှင့် နောက်ဆက်တွဲ ၄-၃ တွင် ဖော်ပြထားသည့် လုပ်ထုံးလုပ်နည်းများအတိုင်း ဆောင်ရွက်ပါမည်။

**(စ) စွန့်ပစ်ရေ စီမံခန့်ခွဲမှု**

စွန့်ပစ်ရေကို စီမံကိန်း စွန့်ပစ်ရေသန့်စင်မှု ဝန်ဆောင်မှုသို့ မရောက်ခင် အဆောက်အဦးတိုင်းတွင် တပ်ဆင်ထားသော သန့်စင်စက်ရုံအားဖြင့် ကနဦးသန့်စင်ပါမည်။ ကန်သည် BOD 20mg/ L ထက်ကျော်ပြီး စွန့်ထုတ်ရေသည် NEQG (အပိုင်း ၄.၁.၇) စံနှုန်းများကို ကျော်လွန်နေသောအခါ ဆောင်ရွက်ပါမည်။ pumps များ အဆင်သင့်ထားရှိပြီး အရံ pump များကို အရေးပေါ်အတွက် အရံသင့် ပြင်ဆင်ထားရပါမည်။ မြောက်ဘက် အထိုင်ကန်မှ စွန့်ပစ်ရေများကို ထားဝယ်မြစ်အတွင်းသို့ စွန့်ထုတ်ပြီး တောင်ဘက် အထိုင်ကန်မှ စွန့်ပစ်ရေများကို ခွန်ချောင်းမြစ်အတွင်းသို့ စွန့်ထုတ်ပါမည်။

**(ဆ) မီးကာကွယ်ခြင်းနှင့် အရေးပေါ်**

စီမံကိန်းသည် နေထိုင်သူများနှင့် ဝန်ထမ်းများအတွက် မီးဘေး ရှောင်ခြင်းနှင့် အရေးပေါ်များ ကြိုတင်လေ့ကျင့်မှုများ ရှိပါမည်။ ၎င်းသည် အပိုင်း ၄.၁.၁၀ တွင် ဖော်ပြထားသည့် ဆောင်ရွက်မှုများအတိုင်း မီးနှင့် အရေးပေါ် ဖြစ်ရပ်များအတွက် ကြိုတင်ဆောင်ရွက်မှုဖြစ်ပါသည်။ မီးနှင့် အရေးပေါ် တားဆီးမှု အစီအစဉ်တွင် တားဆီးမှုများ၊ အဖွဲ့များ၏ တာဝန်နှင့် ဆောင်ရွက်ရမည့် ကဏ္ဍ၊ ပြန်လည်ကုစားခြင်းနှင့် စုံစမ်းခြင်းတို့ ပါဝင်ပါသည်။

**(ဇ) အလုပ်အကိုင်**

စီမံကိန်းသည် ဒေသခံ ဝန်ထမ်းများကို စိမ်းလန်းဧရိယာများ စီမံခန့်ခွဲမှုနှင့် မြို့နယ်ထိန်းသိမ်း လည်ပတ်ရန်အတွက် စတင်ခန့်အပ်သွားပါမည်။ (ဥပမာ- လျှပ်စစ်ပညာရှင်၊ ရေပိုက်သမား၊ ဥယျာဉ်မှူးနှင့် သန့်ရှင်းရေး စသည်ဖြင့်)။ အလုပ်ခန့်အပ်မှု စံနှုန်းများသည် နောက်ဆက်တွဲ ၄-၄ လုပ်ငန်းခွင်ကျန်းမာရေးနှင့် ဘေးကင်းလုံခြုံမှု စံချိန်စံညွှန်း၏ ယခင်အပိုင်း ၃.၂.၃ တွင်ဖော်ပြပြီး ဥပဒေနှင့် စည်းမျဉ်းစည်းကမ်းများကို လိုက်နာပါမည်။

**၁.၃.၈ စီမံကိန်း အခြားရွေးချယ်စရာများ ဖော်ပြချက်**

**၁.၃.၈.၁ စီမံကိန်းနေရာ ရွေးချယ်ခြင်း**

နေရာ (၄) နေရာကို DSEZ ၏ အခြားရွေးချယ်စရာနေရာများအဖြစ် ရွေးချယ်ထားပါသည်။

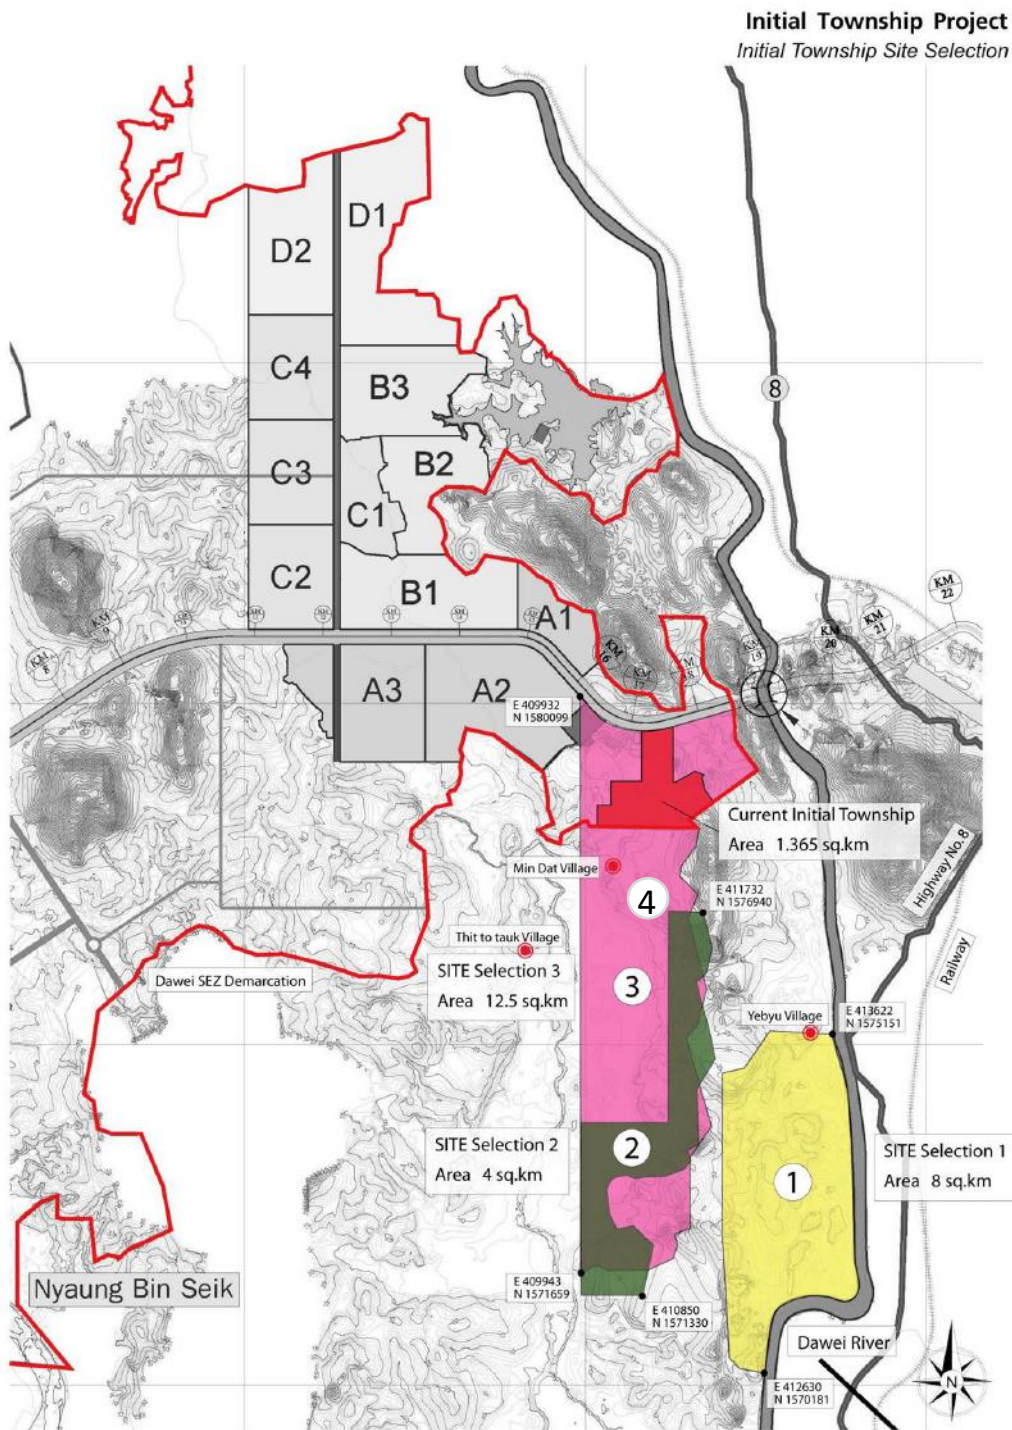

**(က) နေရာ (၁)**

စုစုပေါင်း ၈ စတုရန်း ကီလိုမီတာသည် မြေပြန့်နှံ့ပြီး ထားဝယ်မြစ်တစ်လျှောက် ဝန်းရံထားသော တောင်တန်းနှစ်ခု ရှိပါသည်။ နေရာသည် ဖွံ့ဖြိုးသော မြစ်ကမ်းပါးမြို့ဖြစ်ပြီး အပန်းဖြေအနားယူ ပန်းခြံများ ရှိပါသည်။ သို့သော်လည်း လက်ရှိ ယဉ်ကျေးမှုနှင့် တောင်တန်းနေရာများရှိ ကိုးကွယ်မှုများကို သက်ရောက်မှုများ မဖြစ်ခင် ရေဖြူ၊ ကျောက်ထုနှင့် စင်ပုနစ် ရွာ သုံးရွာကို နေရာပြောင်းရွှေ့ရပါမည်။ နေရာသည် ထားဝယ်မြစ်မှ ရေလွှမ်းမိုးမှု ခံနေရပြီး လက်ရှိ အမြင့်ထက် ၁၀ မီတာ တိုးမြင့်သွားပါမည်။ (၂၀၁၅ မေးမြန်းခြင်းမှ)။ မြို့နယ်တည်ဆောက်ရန် နေရာသည် DSEZ အဓိကလမ်းမကြီးမှ လမ်းဆက်သွယ်မှု အကွာအဝေးများကို တိုးမြှင့်ရန် လိုအပ်ပါသည်။ ပို့ဆောင်ရေးနှင့် နေထိုင်မှုများအတွက် ကုန်ကျစရိတ်များ ရှိလာနိုင်ပြီး လမ်းပိတ်ဆို့မှုများမှာ ပြဿနာတစ်ရပ် ဖြစ်လာနိုင်ပါသည်။

**(ခ) နေရာ (၂)**

ယခင် နေရာ (၁) ကဲ့သို့ စုစုပေါင်း ၄ စတုရန်းကီလိုမီတာရှိသော်လည်း ထားဝယ်မြစ်မှ ဝေးပါသည်။ ထို့ကြောင့် နေရာသည် ရေလွှမ်းမိုးမှု သက်ရောက်နိုင်ချေ နည်းပါသည်။

ပုံ ၁.၄-၁ နေရာရွေးချယ်ခြင်းနှင့် အခြားနည်းလမ်းများ

**(a) Site No.3**

The total of 12.5 square kilometers has similar feature as the previous site no. 2. The site is all bounded by three hills, KaNyin Gauk, Tha Pye Zun and Ga Nan Taung and the demarcation line of the Dawei Industrial Estate in the south. The site is potentially developed as a nice mountainous community. However has one existing village, Min Dat village.

ပုံ ၁.၃-၃ စီမံကိန်းနေရာချပုံနှင့် နောက်ဆုံး အဓိကစီမံချက်

၁.၄ ပတ်ဝန်းကျင်ဖော်ပြချက်

၁.၄.၁ ဘူမိဗေဒလေ့လာမှုနေရာ

၁.၄.၁.၁ ဘူမိဗေဒ လေ့လာမှုနေရာ

ဘူမိဗေဒလေ့လာမှုနေရာသည် အခြေခံအချက်အလက်ကောက်ယူသော စီမံကိန်းနေရာဝန်းကျင် ဖြစ်သင့်ပါသည်။ ဤလေ့လာမှုနယ်ပယ်တွင် ဘူမိဗေဒ လေ့လာမှုနယ်ပယ်သည် စီမံကိန်းနေရာဗဟိုမှ ၅ ကီလိုမီတာအကွာထိ ရှိပါသည်။ ဤဘူမိဗေဒလေ့လာမှုနယ်ပယ်သည် ပုံ ၁.၄-၁ တွင်ပြထားသည့်အတိုင်း စီမံကိန်းနေရာပတ်လည် ၇၈.၅၇ စတုရန်းကီလိုမီတာထိ ရှိပါသည်။

၁.၄.၁.၂ နောက်ဆက်တွဲ လေ့လာမှုနယ်ပယ်များ

EIA လမ်းညွှန်ချက်ထဲတွင် နောက်ဆက်တွဲ လေ့လာမှုနယ်ပယ် (၄) ခုရှိပါသည်။

(၁) ရုပ်ပိုင်းဆိုင်ရာကဏ္ဍ (၂) ဇီဝဗေဒဆိုင်ရာကဏ္ဍ (၃) လူမှုစီးပွားဆိုင်ရာကဏ္ဍ နှင့် (၄) ယဉ်ကျေးမှုကဏ္ဍ တို့ ဖြစ်ပါသည်။

၁.၄.၂ ရုပ်ပိုင်းဆိုင်ရာကဏ္ဍ

၁.၄.၂.၁ မြေမျက်နှာသွင်ပြင်

စီမံကိန်းဧရိယာသည် မြေပြန့်ဖြစ်ပါသည်။ ခွန်ချောင်းမြစ်သည် မြောက်မှတောင်သို့ စီးဆင်းနေသော ဧရိယာအတွင်း တစ်ခုတည်းသော မြစ်ဖြစ်ပါသည်။ စီမံကိန်း ဧရိယာအနီးဝန်းကျင်ရှိ မြစ်သုံးမြစ်မှာ နတ်ဘီလူးမြစ်၊ ထားဝယ်မြစ်နှင့် ပန်းဒင်အင်းချောင်းမြစ်တို့ ဖြစ်ပါသည်။

၁.၄.၂.၂ ဘူမိဗေဒ

စီမံကိန်းဧရိယာသည် ပြည်ထောင်စု သမ္မတမြန်မာနိုင်ငံ၏ ဘူမိဗေဒ မြေပုံအရ Q-2 Holocene နှုန်းမြေပေါ်တွင် တည်ရှိပါသည်။ Holocene မြေလွှာများကို ကျောက်စရစ်ခဲကြီးများမှစ၍ သဲ၊ နှုန်းမြေ၊ နှင့် ကျောက်စရစ်ခဲ အသေး၊ အလယ်အလတ်နှင့် ဝါကျင်ကျင် ရွံ့စေးများအဖြစ် ခွဲခြား သတ်မှတ်ထားပါသည်။

၁.၄.၂.၃ ငလျင်တိုင်းတာခြင်း

စီမံကိန်းဧရိယာသည် ဇုန် (၁) တွင် တည်ရှိပြီး ၎င်းဇုန်သည် ထိခိုက်မှုနည်းသောဇုန်ဖြစ်ပါသည်။ ဤဇုန်တွင် မြေတုန်နှုန်း ၀.၀၇၅ ဂရမ်နှုန်း ရှိပါသည်။

၁.၄.၂.၄ ဆူနာမီ

အနည်အနှစ်များ ဆုံးရှုံးခြင်း (သို့) များပြားလာခြင်းမှ ကြီးကြီးမားမား ထိခိုက်မှုများ ထားဝယ်ကမ်းရိုးတန်းတစ်လျှောက် မရှိခဲ့ဖူးပါ။

**၁.၄.၂.၅ ရေ**

အနောက်ဘက်တွင် အက်ဒမန်မြစ်ဝှမ်းနှင့် အရှေ့ဘက်တွင် ထားဝယ်မြစ်ဝှမ်းတို့ရှိပြီး ထားဝယ်မြစ်နှင့် ခွန်ချောင်းမြစ်တို့သည် ထားဝယ်မြစ်ဝှမ်းတွင် ပါဝင်ပါသည်။

**၁.၄.၂.၆ လေအရည်အသွေး**

လေအရည်အသွေး တိုင်းတာရန်အတွက် စီမံကိန်းဧရိယာအနီးတွင် နမူနာကောက်ယူသည့်နေရာ လေးခုရှိပါသည်။

- ၂၄ နာရီအတွက် TSP နှင့် PM<sub>10</sub> တို့၏ ပါဝင်မှုသည် အထူးသဖြင့် နေ့ပိုင်းတွင် မြင့်မားနေတတ်ပါသည်။
- SO<sub>2</sub>၊ NO<sub>2</sub> နှင့် CO ပါဝင်မှုများကို World Bank၊ U.S.EPA နှင့် WHO စံချိန်စံညွှန်းများနှင့်အညီ ဆောင်ရွက်ပါသည်။
- THC၊ MHC နှင့် NMHC တို့အတွက် စံချိန်စံညွှန်းများ မရှိသေးသော်လည်း အခြေခံအချက်အလက်များအဖြစ် ကောက်ယူပါမည်။

**၁.၄.၂.၇ ဆူညံသံနှင့် တုန်ခါမှု**

L<sub>Aeq</sub> နှင့် L<sub>Amax</sub> တို့ကို U.S.EPA နှင့် ထိုင်းစံနှုန်းအရ ခြောက်သွေ့ရာသီနှင့် မိုးရာသီ နှစ်ရာသီလုံး ၂၄ နာရီ တိုင်းတာပါသည်။ မည်သည့်အဆောက်အဦးမျှ မထိခိုက်သော အမြင့်ဆုံး တုန်ခါမှုနှုန်းမှာ ၂.၀ mm/s ထက် မများရပါ။

**၁.၄.၂.၈ မြေအောက်ရေ အရည်အသွေး**

၂၀၁၅ ခုနှစ် မတ်လ ၂ရက်မှ ၁၄ ရက်အတွင်း စီမံကိန်းဧရိယာအနီး မြေအောက်ရေနမူနာကောက်ယူရာ နေရာနှစ်ခုမှ နမူနာ ကောက်ယူခဲ့ပါသည်။ သတ္တုမှလွဲ၍ ရလဒ်များအားလုံးကို စံချိန်စံညွှန်းများနှင့်အညီ ဆောင်ရွက်ပါသည်။

**၁.၄.၂.၉ မြေပေါ်ရေအရည်အသွေး**

ဖေဖော်ဝါရီ ၂၀၁၅ တွင် ရေနမူနာငါးခုကို ကောက်ယူခဲ့ပါသည်။ နမူနာနှစ်ခုကို ထားဝယ်မြစ်မှ ကောက်ယူပြီး အခြား သုံးခုကို စီမံကိန်းဧရိယာရှိ မြစ်နှင့် ချောင်းမှ ကောက်ယူခဲ့ပါသည်။ SW1 ကို စီမံကိန်းမြောက်ဘက်ရှိ အီကန်မြစ်မှ ယူခဲ့ပြီး SW2 ကို စီမံကိန်းတောင်ဘက်ရှိ Yalai ချောင်းကွေ့မှ ယူခဲ့ပါသည်။

တိုင်းတာမည့် Parameters များကို ထိုင်းနိုင်ငံ ရေစံချိန်စံညွှန်းနှင့် ဆောင်ရွက်ပါသည် (အခန်း ၅ တွင် အသေးစိတ် ဖော်ပြထားပါသည်)။ SW1 တွင် Do 5.8 mg/l၊ အစိုင်အခဲနည်းပြီး မာကျူရီ 0.0002mg/l ရှိပါသည်။ သို့သော် အဝါရောင် SW2 သည် DO 4.2 mg/l နှင့် BOD၊ COD နည်းသည်ကို တွေ့ရပါသည်။ ထားဝယ်မြစ်မှ နမူနာများသည် DO ပါဝင်မှု များပြားပြီး (6mg/l နီးပါး) အနည်များသည်ကို တွေ့ရပါသည်။

၎င်းတို့၏ TSS သည် 1417 မှ 1836 mg/l ထိ ရှိပါသည်။ Coliform bacteria နှင့် E. Coli များကို ထားဝယ်မြစ်မှ နမူနာများအားလုံးထဲတွင် မတွေ့ရပါ။

**၁.၄.၂.၁၀ အနည်အရည်အသွေး**

မာကျူရီမှလွဲ၍ အနည်နမူနာအားလုံးကို အဆိုပြု အနည်အရေအသွေး စံနှုန်းများနှင့် ဆောင်ရွက်ပါသည်။ SW1 နှင့် SW2 54.9 နှင့် 44% သဲများဖြင့် ဖွဲ့စည်းထားပြီး Heavy metals အချို့ကိုလည်း တွေ့ရပါသည်။ SW3 နမူနာကောက်ယူရာနေရာသည် ရွှံ့စေး (58.39%) နှင့် မာကျူရီနှင့် သံ (0.719 နှင့် 26,078 mg/kg) ဖြင့် ဖွဲ့စည်းထားပါသည်။ SW4 နှင့် SW5 ကို ရွှံ့စေး (47 နှင့် 63.7 %) ရှိသော ထားဝယ်မြစ်မှ ကောက်ယူထားပါသည်။ အနည်နမူနာများတွင် တွေ့ရသော Heavy metals များမှာ arsenic, zinc ကြေးနီ၊ သံ၊ ခဲ၊ နီကယ်နှင့် ခရိုမီယမ် တို့ဖြစ်ပါသည်။

**၁.၄.၃ ဇီဝဗေဒ အစိတ်အပိုင်းများ**

**၁.၄.၃.၁ ရေနေဂေဟဗေဒနှင့် ငါးလုပ်ငန်းများ**

- ရေညှိစိမ်းနှင့် diatom တို့သည် phytoplankton ၏ လွှမ်းမိုးသော taxa များဖြစ်ကြပါသည်။ Wilhm နှင့် Dorris (1968) လမ်းညွှန်ချက်အရ စီမံကိန်းဧရိယာအနီးရှိ ရေအရေအသွေးအတွက် အကြံပြုထားသော မျိုးစုံမျိုးကွဲ အညွှန်း (H') သည် ရေနေသတ္တဝါများအတွက် သင့်တော်လက်ခံနိုင်သော အခြေအနေတွင် ရှိပါသည်။
- Nauplius Copepod နှင့် Arcella protozoan များကို ပေါ့ပေါ့များများ တွေ့ရပါသည်။
- အဆစ်ပါသော တီကောင်များ၊ အထူးသဖြင့် ရေနှင့် နီးစပ်သော အကောင်များသည် တိုင်းတာသည့်နေရာအားလုံးတွင် လွှမ်းမိုးနေသော မြေအောက်သတ္တဝါများ ဖြစ်ပါသည်။
- ရေချိုပုစွန်များသည် တိုင်းတာသည့် နေရာအားလုံးတွင် လွှမ်းမိုးနေသော ရေနေသတ္တဝါများဖြစ်ပါသည်။
- *Actinoscirpus grossus* (ရေနေအပင်ကြီးမျိုး) သည် ရေထုတွင် လွှမ်းမိုးနေသော မျိုးစိတ်ဖြစ်ပြီး *Acanthus ebracteatus* (ပင်လယ် holly ပင်) နှင့် *Nypa fructicans* (ခနီ) တို့သည် ထားဝယ်မြစ် တိုင်းတာသည့်နေရာများတွင် လွှမ်းမိုးနေသော အပင်များဖြစ်ပါသည်။
- Cyprinid fishes (Cyprinidae: Barb and Minnow) နှင့် Gobiidae (Goby) တို့သည် လွှမ်းမိုးနေသော မျိုးစိတ်များဖြစ်ပါသည်။ ငါးစုစုပေါင်းမှာ တစ်ဟက်တာ ၁၄၀၀မှ ၄၄၀၀ ကောင်အထိရှိပြီး ငါးပေါများမှုမှာ တစ်ဟက်တာလျှင် ၆.၇၉၅မှ ၈.၅၁၀ ကီလိုဂရမ်အထိ ရှိပါသည်။
- ငါးလုပ်ငန်းများ- Pushnet boats, gillnet, fish trap, dip net, fish net နှင့် ငါးမျှားချိတ်များသည် ဒေသခံငါးဖမ်းသမားများ အသုံးပြုသော ငါးဖမ်းကိရိယာများ ဖြစ်ပါသည်။

**၁.၄.၃.၂ သစ်တောများ**

စီမံကိန်းဧရိယာအတွင်း သစ်တောများကို ဒီရေတော၊ ကြိုးဝိုင်းတောနှင့် သဘာဝတောဟူ၍ သုံးမျိုး ခွဲခြားထားပါသည်။ IUCN Red list အရ *Cerriops decandra* မျိုးစိတ်ကို ဒီရေတောတွင်

တွေ့ရပါသည်။ ကြီးပိုင်းတောအတွင်းတွင် IUCN Red list အတွင်းရှိ မျိုးစိတ်များ မပါဝင်ပါ။ IUCN Red list တွင် ပါဝင်သော မျိုးသုန်းပျောက်ကွယ်ရန် အန္တရာယ်ရှိသော မျိုးစိတ်တစ်ခုနှင့် အရေးပေါ် မျိုးသုန်းပျောက်ကွယ်ရန် အန္တရာယ်ရှိသော မျိုးစိတ်နှစ်ခုကို သဘာဝတောတွင် တွေ့ရပါသည်။ ပထမတစ်ခုမှာ Diospyros crumentata ဖြစ်ပြီး နောက်နှစ်ခုမှာ Dipterocarpus kerrii နှင့် Dipterocarpus turbinatus တို့ ဖြစ်ပါသည်။ Hopea odorata မျိုးစိတ်ကိုလည်း တောထဲတွင် တွေ့ရပါသည်။

**၁.၄.၃.၃ တောရိုင်းတိရစ္ဆာန်**

ကျောရိုးရှိ သတ္တဝါလေးမျိုးကို တွေ့ရှိရပါသည်။ (တွားသွားသတ္တဝါ၊ ကုန်းနေရေနေသတ္တဝါ၊ ငှက်မျိုးစိတ်များနှင့် နို့တိုက်သတ္တဝါများ ဖြစ်ပါသည်။ စပါးကြီးမြွေ (*Python molurus bivittatus*) သည် IUCN Red list တွင်ပါဝင်သော အန္တရာယ်ရှိ မျိုးစိတ်တစ်ခု ဖြစ်ပါသည်။ is an endangered species reptile listed in the IUCN Red-list. အရှေ့အာဆီယမ် porcupine (*Hystrix brachyuran*) နှင့် အမြီးရှည်ဆိတ် (*Naemorhedus caudatus*) တို့သည် IUCN Red list ရှိ ထိခိုက်ခံစားလွယ်သော နို့တိုက်သတ္တဝါမျိုးစိတ် ဖြစ်ပါသည်။

**၁.၄.၄ လူမှုစီးပွားအခြေအနေများ**

- ရွာ၁၈ ရွာတွင် အိမ်ခြေ ၅၈၃၄ အိမ်ထောင်စု ရှိပါသည်။ စုစုပေါင်းလူဦးရေမှာ ၃၅၄၄၃ (ကျား- ၁၆၆၂၈ နှင့် မ- ၁၈၈၀၅) ရှိပါသည်။ အများဆုံးလူဦးရေ ၇၇၀၀ ဦးမှာ ပင်လယ်ရေကမ်းခြေရှိပြီး လူဦးရေအနည်းဆုံး (၃၂၈ဦး) မှာ ညောင်ပင်ဆိတ်ရွာတွင် ဖြစ်ပါသည်။
- ၂၀၁၃ တွင် REM ၏ ရွာတွင်း ကွင်းဆင်းလေ့လာမှုအရ သက်ရောက်ခံ ၁၈ ရွာတွင် တိုင်းရင်းသား လူမျိုးစုများ နေထိုင်ခြင်း မရှိပါ။
- လေ့လာမှုအရ မြန်မာနိုင်ငံပညာရေးစနစ်ကို မူကြို၊ မူလတန်း၊ အလယ်တန်းနှင့် အထက်တန်းဟူ၍ လေးဆင့် ခွဲထားပါသည်။ တစ်ရွာစီတွင် ကျောင်းတစ်ကျောင်းစီရှိပြီး ကျခတ်တပင်ရွာတွင် နှစ်ကျောင်းရှိပါသည်။
- မြေအသုံးချ လေ့လာမှုကို ရေဖြူနှင့် လောင်းလုံတွင် ဆောင်ရွက်ပါသည်။ ရေဖြူကွင်းဆင်းလေ့လာမှုအရ ဧရိယာ၏ သုံးပုံနှစ်ပုံသည် သစ်တောအဖြစ် ထိန်းသိမ်းထားခြင်း မရှိသေးပါ။ ၁၂% ခန့်ကို စိုက်ပျိုးမြေအဖြစ် ပြောင်းလဲပြီး ဖြစ်ပါသည်။ လောင်းလုံ ကွင်းဆင်းလေ့လာမှုအရ စုစုပေါင်းဧရိယာ၏ သုံးပုံတစ်ပုံကို စိုက်ပျိုးမြေအဖြစ် အသုံးပြုပြီး ကျန်သုံးပုံနှစ်ပုံကို သဘာဝအတွက် ချန်ထားပါသည်။
- လဲရှောင်နှင့် ပန်းဒင်ရွာရှိ ကျေးလက်ဆေးခန်းများကို အတွေ့အကြုံရှိ အပြာဝတ်သူနာပြုများက ကူညီလုပ်ဆောင်ပေးပါသည်။(LHV Lady Health Assistance)

# CHAPTER 1

## EXECUTIVE SUMMARY

### 1.1 CONTEXT OF THE PROJECT

#### 1.1.1 Propose of the Study

Objective of the Environmental and Social Impact Assessment (EIA) is to assess the environmental and social impacts caused by development of the “*Initial Township*” (hereinafter referred to as “*the Project*”) in Dawei Special Economic Zone by Dawei Residence Company Limited (DRC) and consider the Environmental Management Plan (EMP) including mitigation measures to reduce and minimize the negative impacts caused by the Project.

Approximately, 1.365 square kilometers in DSEZ (Figure 1.1-1) will be developed a quality residence (Figure 1.1-2) with a range of commercial facilities and recreations that will raise living standard of workers both Myanmar citizen and foreigners who will live and work in DSEZ. The Project is designed for maximum capacity of 135,080 peoples for the initial phase and will be able to expand up to 5.58 square kilometer or 370,116 peoples in the final phase. These will be achieved through construction and operation of the following components:

- Multi-stories Apartments
- Retails Shops
- Commercial venue
- Facilities Center
- Fire prevention and emergency response system
- Communication system
- Security system
- Transportation hub and
- Recreation.

According to the Environmental Conservation Law (2013) and the Environmental Impact Assessment Procedure (No.616/2015) issued by the Ministry of Natural Resource and Environmental Conservation (MONREC), the EIA study is required for the Project as “*Tourism and Hospitality Development*”. To implement the legal compliance, DRC delegates United Analyst and Engineering Consultant Co., Ltd. (UAE) in conducting the EIA for the Project. In this report, UAE is referred to “*The EIA Study Team*”.

**Figure 1.1-2 Project Overview**

### 1.1.2 Related Projects

The DSEZ project had been developing since 2010, started from the framework agreement of deep sea port and industrial estate. In late 2015, the Initial Phase of DSEZ was concreted with the recent features, more substantial and attractive for foreign investors. The recent projects (Figure 1.1-2) were emerged with the following components:

- Road linked to Thailand
- Ports and LNG terminal
- Initial power plants
- Reservoir and weir
- Initial Industrial Estate
- Telecommunication lines

Two-lane road is a key connection between the DSEZ and Thailand, and the other regions in South East Asia. The road is a major linked land transport from coast of The Andaman Sea through the Gulf of Thailand and The South China Sea. The project is 138 kilometers in length starting from Km.18+500 main road in DSEZ crossing through Thai-Myanmar border and finishing at Hti Hkee. The road linked to Thailand at Ban Phu Nam Ron district in Kanchanaburi. Most of sections are in Myanmar and only 5 kilometers of section 3 is in Thailand. Once, the road operates, toll pass, tax and custom will be applied.

Dawei port consisting of 100-m long jetty berth for multi-purpose vessels (Approx. 400 TEU or 13,000 DWT) with estimated capacity of 330,000 ton per year has been recently completed. In order to enlarge the port capability, this commercial berth is planned to improve for Panamax vessel, 60,000 DWT with approximate capability of 14 million ton per year. The berth is now under construction and planned to operate in 2020. LNG terminals located in vicinity of Dawei port will supply economical and clean energy for the region. Total capacity of the LNG terminals are 6 million ton per year and majority of this gas will supply gas fire power plants. A 450 MW Power plant is major electricity supply for Dawei SEZ industries e.g. Initial Industrial Estate, Township and Heavy Petrochemical industry. The power plant features conclude switch yards, emergency diesel generators, diesel loading storage tanks and 115-kV transmission lines.

Pa Yain Byu Reservoir and Ta Laing Gya Weir are main water supply serving as water consumption for early industries construction and Initial Industrial uses. The reservoir has 7.14 square kilometers of catchment with maximum capacity of 8.54 million cubic meter. Centralized conventional water treatment plant located in vicinity of the reservoir has capacity of 36,000 m<sup>3</sup> consumable per day. Landline and high-speed internet with speed up to 10 Gbps including the basic telephone (IP Phone), CCTV, Virtual Private Network (VPN), video conference, etc; Mobile Services is to be provided by the existing operators of the country.

Initial Industrial Estate is manufacturing and factories area opening for investment. It is developing by phase, starting from zone A, B, C and D respectively or upon demand of the market. The industrial estate will consist of facilities i.e. central wastewater treatment system, solid waste management system, flood controlling system etc.

Figure 1.1-3 Related projects in Dawei SEZ

## 1.2 ENVIRONMENTAL AND SOCIAL CONSIDERATIONS

Environmental legislation is superior key in operation and management of the project. Therein, the principle for environmental management are formulated based on consideration of related national Policies, Laws and Regulations. Most of the legislation listed here are recent and still implement in the Union while some Acts are enacted since the union was under administration of the British India. The considerations in this chapter will be deliberately implemented and mandated through various stages of the Project development, from pre-construction, construction, operation and decommissioning.

### 1.2.1 Myanmar Regulatory Framework

#### 1.2.1.1 Institutional Setting of National Level

Myanmar has 21 ministries under the Office of the president as of May 2017. The leading ministries in-charge for environmental and social considerations are the Environmental Conservation Department of the Ministry of Natural Resources and Environmental Conservation (MONREC), is derived from the Ministry of Environmental Conservation and Forestry (MONREC).

#### 1.2.1.2 Legislation Related to Environmental Social and Health Considerations

The fundamental laws and regulations related to the environmental social and health considerations are show in Table 1.2-1 and Table 1.2-2. Also, major international agreement and treaties that Myanmar government has ratified are show in Table 1.2-3.

**Table 1.2-1 Legislation Related to Environmental Social Considerations in the Project**

## 1.2.2 Guidelines and Standards

The Myanmar National Environmental Quality (Emissions) Guidelines was enacted in 2015. This emission (or discharge) guideline applied for air and water quality, noise and vibration is core standard for target values or tentative values in this study. Where some parameters i.e. NO<sub>2</sub>, CO or ambient water quality are absence from the Myanmar NEQG, the strictest standard among Japan, Indonesia, Thailand and Vietnam will be adopted. IFC EHS Guidelines is applied for Social and Health standard containing water quality and availability, structural and infrastructure, life and fire and traffic safety.

### **1.2.3 Corporate Environmental and Social Policies**

The Project proponent will formulate a corporate environmental and social management policy to guide its environmental and social management during the construction phase and the operation phase of the Project. In this regard, the project Proponent will manage environmental aspects of the Project in accordance with the ISO 14001 Environmental Management System. Consequently, the Project Proponent will establish an Environmental Management System (EMS) for the project and will operate the EMS to meet the requirement of ISO14001. The EHS Management will be activated starting from the commencement date of the construction.

### **1.2.4 MONREC's Comments on Scoping and Draft Report**

The draft report was last commented by the MONREC on 17<sup>th</sup> July 2017. The Environmental Conservation Department (ECD) suggested to revise and re-consider various sections i.e. resettlement plan and compensation, emergency response plan to natural disaster, environmental, health and safety plan and legal commitments, training and CSR program. The comments were summarized in *Section 2.6*.

## **1.3 PRESENTATION OF THE PROJECT**

### **1.3.1 Project Location**

The Project is located in Dawei province (Tavoy) in the Tanintaryi region and in Dawei Special Economic Zone, which is bounded by the Andaman Sea in the west and the Dawei River in the east. The Project is approximately 30 kilometers north of the Dawei airport and the Dawei city center. The Project can be accessed by the Yangon-Mandalay highway and then the highway no.8 from the north.

### **1.3.2 Project Development**

Development of the Initial Township will be by phases. To begin with phase 9+1 and then phase A, B, C and D will be developed, respectively. Development plan is presented in Table 1.3-1.

#### **1.3.2.1 9 plus 1 Phase**

Development of the Initial Township will begin with phase 9 plus 1. Nine buildings of Workforce apartment and one Service apartment will be built at this stage. Basic need infrastructure e.g. Township main road, water and power supply will also be constructed. Location of phase 9 plus 1 is in Figure 1.3-1.

**Table 1.3-1 Project Development Phasing**

Year	Phase	Construction Plan					
		5-Floor Workforce Apartment (700 Pers./Bldg.)	Capacity (Pers.)	8-Floor Serviced Apartment (222Pers./Bldg.)	Capacity (Pers.)	3-Floor Retail Shops (120 Pers./Bldg.)	Capacity (Pers.)
Year 1	Start Construction 9+1	9	6,300	1	167	0	0
Year 3	A	26	18,200	Upon Market Demand Maximum 20 buildings		Upon Market Demand Maximum 62 buildings	
Year 5		23	16,100				
Year 6	B	23	16,100				
Year 7		23	16,100				
Year 8	C	23	16,100				
Year 9		23	16,100				
Year 10	D	17	11,900				
<b>SUM</b>		<b>167</b>	<b>116,900</b>				

Source: DRC (2015)

Source: DRC (2017)

**Figure 1.3-1 Location of Phase 9 Plus 1 (in square) and the other phases.**

### 1.3.2.2 Other Phases

Initial Township will be entitled with residential buildings, infrastructure and facilities in full phase. Infrastructure are Road Network, water and power supply and Flood Protection System. Facilities are recreation; public area and green area, commercial venue, transportation hub, fire station and police station. These facilities will be developed by phases in accordance with the mentioned plan until completion. Supporting facilities are such as health center or hospital and school will be built at the time that adequate number of population has been reached.

### 1.3.3 Project Time Schedule

The Project schedule begins with period of the EIA. The Project has 50 years of the concession agreement for the entire project. Construction of Phase 9+1 will start around 2017 or as soon as the EIA approval. Phase A is planning to start in year 3 (See in Table 1.3.-1). However, extension of the other phases will depend on market demand. Operation of the Phase 9+1 will probably start in 2020. Decommissioning will take a few years before the concession agreement is end.

### 1.3.4 Project Components

The Project constitutes residence, commercial venue, facility center and infrastructure. These features has been designed to serve up to 135,080 people and they are as follow:

### 1.3.4.1 Land and Landscape

Initial Township has been designed base on it nature and primitive topography with the aimed concept that topography will be minimal altered and sustain with the environmental setting of the township. In this study, topographic analysis and land grading technique are integrated in layout of the township, to resolve a number and type of buildings in accordance with life style of residents and the buildings concepts as shown in Figure 1.3-2.

Source: DRC (2017)

Figure 1.3-2 Topography Analysis

#### (a) Zoning and Grid Network

The township will consist of three main areas, residential, commercial, recreational and green area. To harmonize these areas together with life style of the communities, road connection and grid network have been designed, not only to accommodate the residents in relation to their environment but also energy efficiency as shown in Figure 1.3-4. Commercial and retails areas will be located in between the apartments to reduce separation and enhance relationship between the residents as shown in Figure 1.3-3.

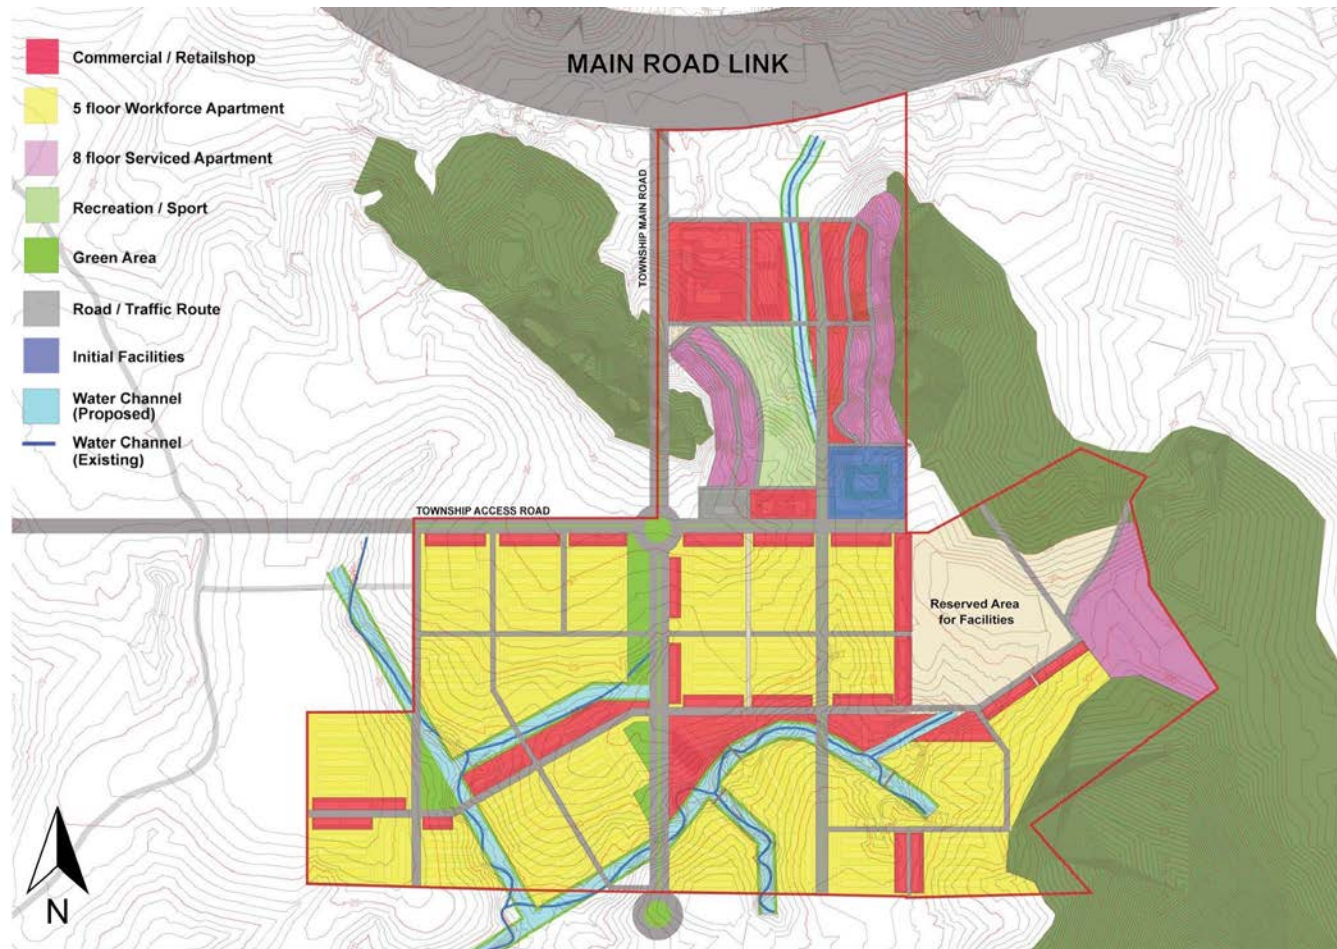

Figure 1.3-3 Typical Block Concept

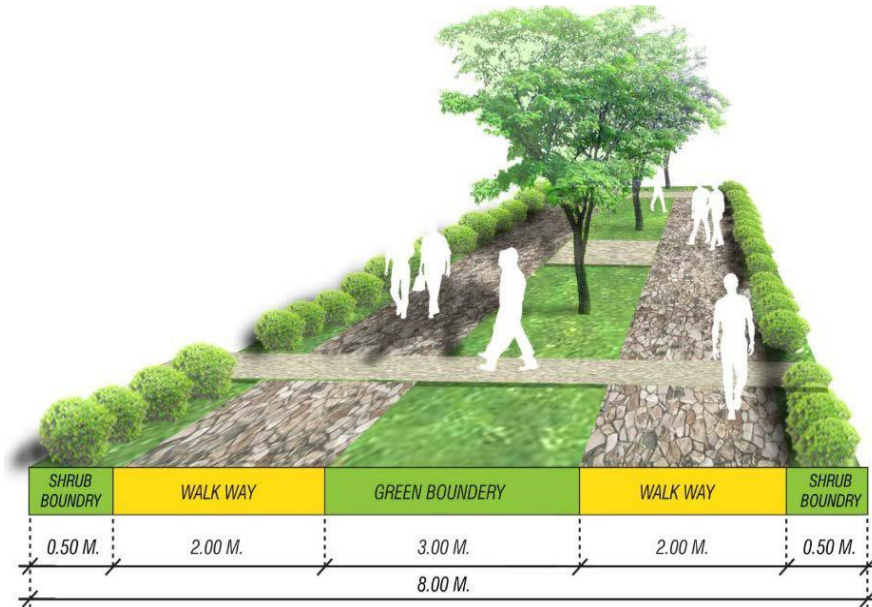

Source: DRC (2015)

Figure 1.3-4 Zoning of Initial Township

**(b) Recreational and Green Areas**

In order to provide sustainable community lifestyle for the residents, various types and scales of public parks are employed to create continuous green area all over the town. The smallest scale of recreational areas will start from the space between 2 buildings and continue the connection into scale of blocks, districts and town as shown in Figure 1.3-5.

Source: DRC (2017)

**Figure 1.3-5 Walk ways and Green Boundaries**

Total green area is about 0.7 square kilometers. Green areas will be developed by phases per extension units of the Project, to support increasing of population in each area such as outdoor, indoor, jogging areas, sport and picnic.

<p><b>POCKET PARK</b></p> <ul style="list-style-type: none"> <li>-small park within one or two building blocks</li> <li>-occupied and maintained by local residents</li> </ul>	<p><b>NEIGHBORHOOD PARK</b></p> <ul style="list-style-type: none"> <li>-linea type which connects with neighborhood park of other blocks.</li> <li>-social and informal recreation type</li> </ul>	<p><b>COMMUNITY PARK</b></p> <ul style="list-style-type: none"> <li>-community based recreational needs</li> <li>-outdoor sport activities</li> <li>-urban green space</li> </ul>	<p><b>DISTRICT PARK</b></p> <ul style="list-style-type: none"> <li>-lines large area of green space along Dawei River</li> <li>-active recreational purposes: swimming, bicycling, picnic</li> <li>-parking lot</li> </ul>	<p><b>CITY PARK</b></p> <ul style="list-style-type: none"> <li>-largest public park in Township area</li> <li>-connected to Urban Public Area: Library, Stadium, Theater</li> <li>-serves recreational and festive purpose: celebration, water-festival</li> </ul>
--	--	---	--	--

Source: DRC (2017)

**Figure 1.3-6 Development of Park and Recreational Areas.**

### **(c) Public Areas**

Public areas are parking, areas between building (both front and back) and common cafeteria. Every 3-floor retail shops have their own parking port in the front. Motorcycles parking ports are shared and in between the blocks as shown in Figure 1.3-6.

#### **1.3.4.2 Residential Buildings**

Residential buildings are 5-floor workforce apartments, 8-floor serviced apartments (Managerial Class) and 3-floor retail shops at international living standard for its residents.

##### **(a) 5-floor apartment**

The 5-floor apartment is an accommodation design for workforce. The main propose is for labor or employee who will regularly work in the plants or factories in the Initial Industrial Estate. The room is typical shared accommodation with bathroom, lavatory, laundry, kitchen and common area etc. Inside a room is approximately 20 square meter and consists of 4 beds (Figure 1.3-7).

##### **(b) 8-floor apartment**

The 8-floor apartment is an accommodation designed for executive who also work in the plants or factories of the Initial Industrial Estate or in DSEZ vicinity. The room is typical private accommodation or “*Condominium*” style. The apartment consists of approximately 100 units. The 1-bed room units ranging from 34 to 54.5 square meters and there are three different types of the room, Studio, Deluxe type 1 and Deluxe type 2 (Figure 1.3-8 and Figure 1.3-9).

##### **(c) 3-floor retails shop**

The 3-floor apartment or 3-storey retail shop is a combined feature of building for commercial and residence. First floor is designed for commercial purpose as retails and the 2<sup>nd</sup> and the 3<sup>rd</sup> floor may be used for residence of the other business purposes. Up to 4 meters wide and over 10 meter in length of useful space for each floor with parking area in the front (Figure 1.3-10).

#### **1.3.4.3 Commercial Buildings**

Commercial areas consist of shops and restaurants. The venue is designed for commercial purpose including public area e.g. canteen for public activities. Pavement in this area will be ground blocks for multi-purpose in case emergency (Figure 1.3-11).

### LOCAL TOWNSHIP APARTMENT

The majority of residents in Local Township come from the workforces in Dawei Industrial Estate. The Local Township Typical Residential Design is a 4 storey apartment building with public area in the center. The design and construction are based on "ENERGY CONSERVATION CONCEPT": **Building orientation, Cross ventilation and Sunlight stack** in order to sustainably maintain the long-term well being of the tenants.

<sup>2</sup> OSR = Open Space Ratio  
<sup>3</sup> BCR = Building Coverage Ratio

Source: DRC (2017)

#### **1.3.4.4 Facilities Center**

##### **(a) Hospital**

Location of the hospital or health center will be in public facility area (See Figure 1.3-12). The hospital will be 60 beds covering 25 Rai or 40,000 square meter and can serve up to 50,000-100,000 people within 15 kilometers. The hospital will be designed in accordance with international standard and built, once population of the Township has reached certain number. Initially, the Township residents will rely on the Dawei Hospital (local hospital).

##### **(b) Police Station**

Location of police station will be in public facility area. The police station can service over 5,000 to 10,000 Rai in radius of 15 kilometers.

##### **(c) School**

Location of school will be in public facility area. The school type, primary school, secondary school and high school will rely on size of population in demands. The school is expect to have 600 to 1,000 students and to service in 1.5 kilometers in radius.

##### **(d) Fire Station**

Location of fire station will be in public facility area. Fire station will includes with fire equipment, fire trucks, fire apparatus including fire brigade staff. Detail of fire station is in *Section 4.1.14, Fire and Emergency Response System*.

##### **(e) Telecommunication Center**

Location of telecommunication center will be in public facility area. The center will cover only 0.5 Rai in service.

##### **(f) Transportation Hub**

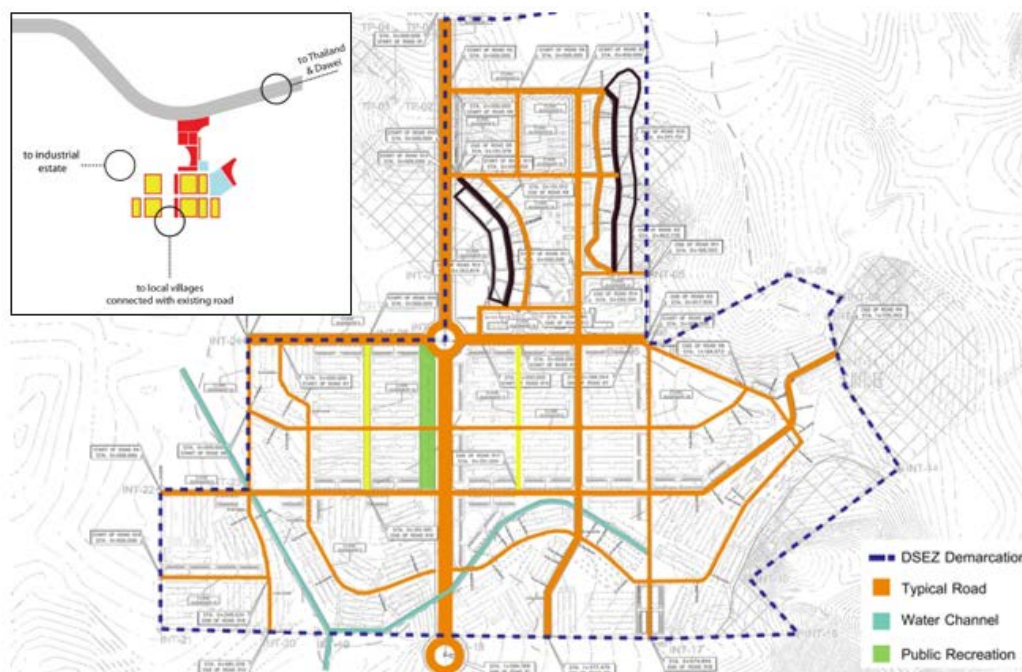

Location of transportation Hub will be in residence area in between service apartment zone 1 and workforce apartment zone 1. It will cover 16,000 square meters.

#### **1.3.4.5 Road Network**

Due to shape of the Project land, is fan-shape, grid system is applied to the Project with multiple accesses, to facilitate residents and prevention of traffic congestion. Grid system is also applied in areas of workforce apartment that are equally divided into blocks and size of these blocks are all in walking distance, to ensure that residents can get off the bus and continue walking to their accommodation. For gated type of community such as serviced apartments, there will be only one or two accesses. This is due to increasing level of privacy and safety. Road and grid network are 3 types as follows;

- Tertiary road is 2-lane,
- Secondary road is 4-lane,
- Main road is 6-lane.

Typical cross-sections of the secondary and tertiary roads are shown in Figure 1.3-12

Source: DRC (2015)

**Figure 1.3-12 Road and Grid Network within Initial Township**

#### 1.3.4.6 Flood Control and Drainage System

The Initial Township is situated in upstream area of the Kun Chuang River, which is in sub-basin of the Dawei basin. The Project is not in the area of seasonal flooding but downstream area of the Kun Chuang River is. From a field investigation revealed that flood marks in 2006 was up to 13 meters above Chart Datum (CD).

Owing to area of the Project is situated in quite altitude. Only retention ponds are designed to hold a certain volume of water from rain in case of periodically flood. One retention pond is for area north in the initial township and the others, two retention ponds are designed for the full phase. Volume of each retention ponds is presented in Table 1.3-3.

**Table 1.3-3 Design of Retention Ponds in Township**

DESIGN RETENTION POND		
duration	6 HR	Rainfall collection 46.45 mm
Zone	Area of Zone	Volum for Retention pond
	m <sup>2</sup>	m <sup>3</sup>
Retention pond TW 1	381,437.960	12,720
Retention pond TW 2	582,473.227	19,590
Retention pond TW 3	639,139.803	21,310

Source: SEATEC (2012)

Design of the retention ponds is based on retaining time (Tc). The retention ponds are designed for holding rainwater for 6 hours. Rainfall intensity and the return period of flooding can be determined by the IDF curve. Maximum rainfall collected within 6 hours in the 50 years cycle of the returning period is 46.5 mm.

#### 1.3.4.7 Power and Electricity Distribution System

The electricity demand for 8-floor serviced apartment and 5-floor workforce apartments is 9,036 and 37,800 VA respectively.

#### 1.3.4.8 Water Treatment and Distribution System

Raw water source for Initial Township is from the small reservoir, Pa Yain Byu. The reservoir is established to supply water to both Initial Township and the initial Industrial Estate. Amount of water supply is estimated and predicted to be sufficient enough and stable for future consumption, with maximum capacity of 8.54 million cubic meters. Details of the Pa Yain Byu is in Annex 4-2.

The raw water will be treated at water treatment plant which is located near the reservoir and is a part of Initial Industrial Estate facility. Treated water will be distributed via the steel pipeline underneath the access road to the distribution station in Zone A2 of the Initial Industrial Estate and then distributed along the main road until at km. 17 and km 18, it is diverted to the Initial Township as shown in Figure 4.1 36.

Alternatively, groundwater resource may be used; however, groundwater quality are quite not good in its quality. Analysis from the existing wells, groundwater are slightly brackish and water is quite acidic. Most of wells have pH ranging between 4.7 and 6.2 and some wells have cadmium and zinc over the standard. Use of groundwater as raw water may be needed extra treatment from routine surface water treatment.

#### 1.3.4.9 Wastewater Treatment System

Septic tank (Onsite Treatment Unit) with the capacity of 90 m<sup>3</sup>/d is prepared to treat wastewater from 5-floor workforce apartment and the capacity of 54 m<sup>3</sup>/d is prepared to treat

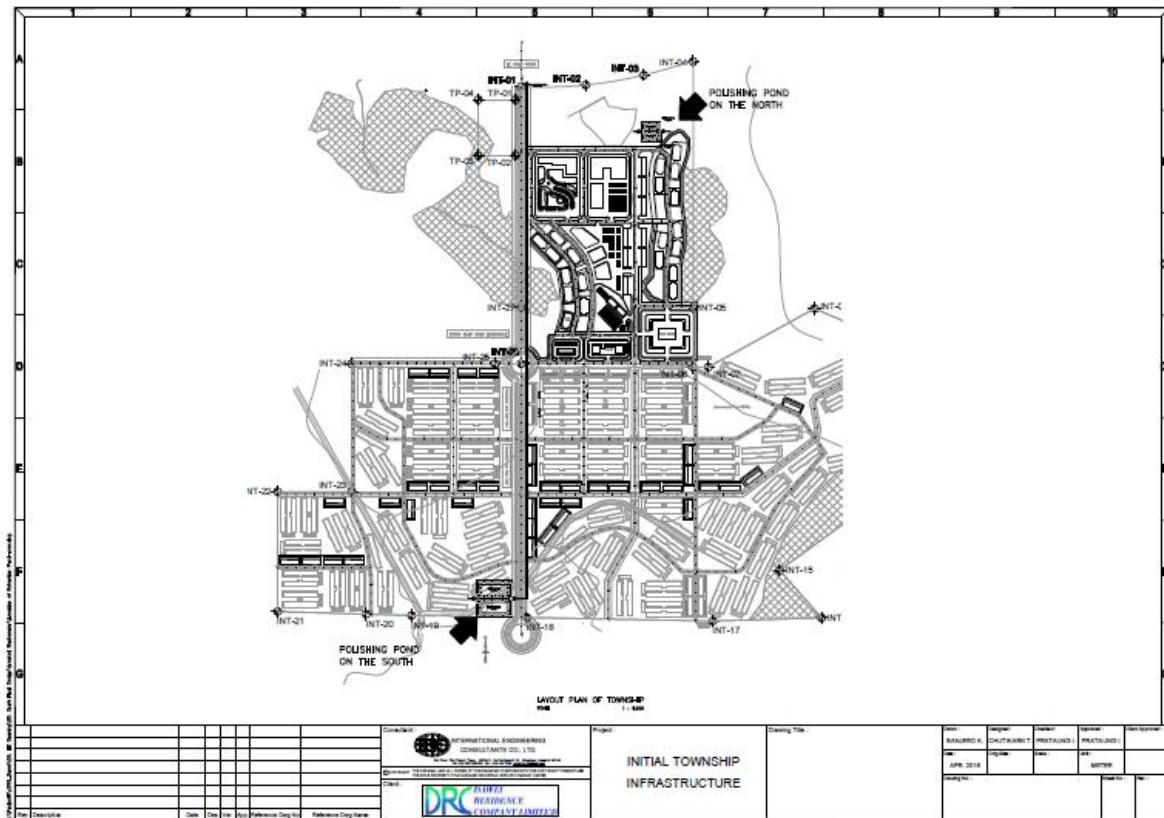

wastewater from 8-floor serviced apartment. Location of Wastewater Treatment Plant is presented in Figure 1.3-13. Wastewater from the septic tanks will then be treated in polishing ponds before draining to public wastewater drainage. Effluent from polishing ponds in initial phase (area for North WWTP) will be discharged into Dawei River.

The wastewater in the polishing pond will be aerated to achieve the standard guideline for effluent at 20 mg/L of the BOD. In case emergency, all the polishing ponds can hold the wastewater for 12 hours. In full phase of development of the Township, wastewater from southern area (Figure 4.1 37) will be treated and then discharged in Kun Chuang River with the required effluent level of BOD 20 mg/L.

#### **1.3.4.10 Solid Waste Management System**

Waste generated from Project's activities, workers and sub-contractors will be managed according to the Dawei Waste Management Plan in Annex 4-3 which is the standard of municipal and industrial waste management, and concordance with the Pollution Control and Cleaning Department (PCCD) waste management policy and procedures.

Source: DRC (2015)

**Figure 1.3-13 Location of Wastewater Treatment System of the Township**

The Project will implement mitigation measures that will conserve energy and the efficient uses about waste management in sequences such as Remove source, Reduce at source, Reuse, Recycle, Recover, Treat and Disposal. Besides, waste will be segregated or separated according to their characteristics. Basically, there are non-hazardous waste and hazardous waste, details are in Chapter 4, Solid Waste Management System and summarized below:

**(a) Segregation and/or separation**

All types of waste needs to be segregated/separated at source before disposal (Figure 1.3-15). The Project will provide segregation bins in color according to their characteristics (Figure 1.3-14)

Source: EIA Study Team

**Figure 1.3-14 Segregating or Separating color bins for waste**

#### Non-hazardous waste and recycling

Are aluminum can, plastic bottles and paper etc. will be initially stored in the labeled yellow bins and will then be collected and managed further for recycling. Duration of the storage will be around a week.

#### Non-hazardous waste and non-recycling

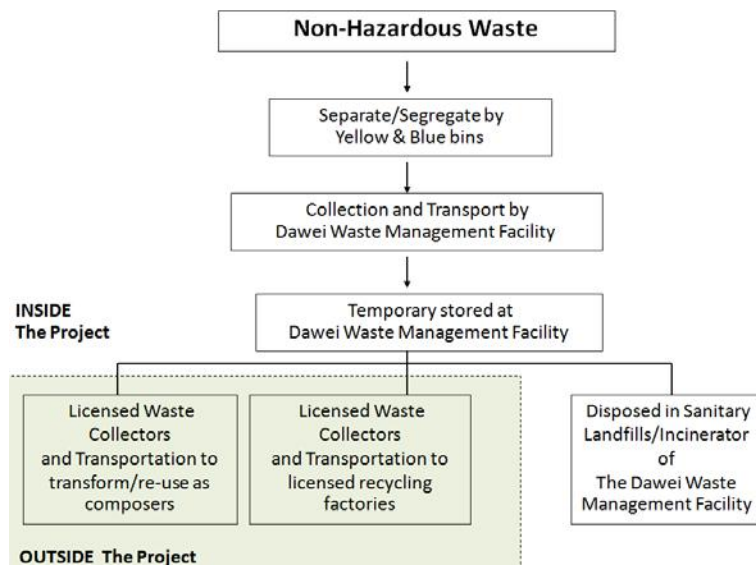

Are such as food waste or plastic for food containers. The waste will be stored in the labeled blue bins before further management such as transformed the waste into compose or disposal. The waste will be collected daily and will be delivered to the Waste Management System (see details in Chapter 4) by licensed third party or Dawei Waste Management Center for disposal or transformation to the other materials.

#### Hazardous waste

Will be initially stored in red containers. Hazardous waste will be collected on bi-weekly basis and delivered to the Dawei Waste Management Facility. Handling of hazardous waste will require manifest and will be managed by licensed third party or the Dawei Waste Management Center itself.

#### ***(b) Waste storage***

The waste will be stored in 200 liters of drums/ or appropriate containers according their hazardous characteristics at the center facility. Storage of hazardous waste will be complied by the relevant laws. Basically, the waste will be stored under confined and roof buildings that lay on concrete floor, which having good sum pit to collect wastewater, and in good ventilated condition. The waste will be stored no more than 6 months before treatment and/or disposal in the hazardous waste landfills or incinerator of the Dawei Waste Management Facility.

Source: EIA Study Team

**Figure 1.3-15 Management of Non-Hazardous Waste generated in the Project**

**(b) Disposal Facilities**

Solid waste management facilities are located in Zone A1 of the Initial Industrial Estate. The Project has undertaken the feasibility study of waste management e.g. landfills capacity in such long-term up to 50 years of the Project development. The research reveals that disposal in landfills will enable up to only 14-15 years due to space limitation of the Project disposal system. The total number of the landfills is only 10 and they will serve both from industry and township. Waste management and design of the disposal facilities are presented in Annex 4-2. The details include i.e. analysis of type and source of waste, rate of generation both township and Township, landfills capacity and their life span, landfill liners (Figure 4.1-44), waste transportation, landfill gases and management system and leachate generation and management system.

Source: IEC (2016)

**Figure 1.3-16 Final cover for non-hazardous waste and hazardous waste landfills**

Infectious waste generated from hospital and health care facility in the Initial Township supposes to managed and dispose within the township by incinerator; however, upon demand of health care service, the infectious waste will be disposed at the Dawei hospital or alternatively in Yangon dumping sites, initially. Transportation of the infectious waste will require manifest as regular. Rate of infectious waste generation from the township is shown in Table 4.1-11 in Chapter 4.

#### **1.3.4.11 Fire Prevention System**

The Project has designed fire prevention system in accord with Myanmar laws and regulation in Section 3.2.3.4 (f) and Annex 4-4), Thai Building Control Act, 1979 and NFPA standard. The Fire Prevention System for the apartments including 5-floor workforce apartments and 8-floor service apartments constitutes of components as follow:

##### **(a) Fire Alarm System**

Fire Alarm System constitutes of 7 components; Alarm Control Panel, Graphic Annunciator, Fire Alarm Manual Station, Fire Phone Jack, Fire Alarm Speaker with Strobe Light, Fixed Temperature Heat Detector and Smoke Detector.

##### **(b) Lightning Protection System**

The system is convention that consists of lighting arrester rod, conductor, downward conductor and ground pike lung. The downward conductor is made of copper and charges distributor for electrical constant. The Project will install Lighting Arrester System and ground spike system on ground floor of each buildings and lightning rod on roof of each building.

##### **(c) Fire Fighting System**

The Project has planned to establish Fire Fighting System (FFS) that enables to cope with fire incidents and emergency for a level. The Project has itself FFS such as installation of FFS for each residential buildings and supporting firefighting facilities from nearby towns in case severe fire.

##### Residential Buildings Fire Fighting System

Fire Fighting System constitutes of 6 components, Standing Pipe System, Fire Hose Cabinet, Fire Department Connection, Fire Extinguisher, Fire Exit, Fire Escape Sign and Emergency Light and Fire Escape Route Map and Extinguisher Location.

##### Township Fire Station

The Project has a plan to establish the fire station, which will be a share facility between the Initial Industrial Estate and the Project. Also, the Project plans to form reserve fire brigade team in accordance with the said law that is not only to operate and manage the fire station/fire work, but also to co-ordinate with the Fire Service Department and relevant agencies in preparation for fire incidents i.e standardized fire apparatus (See Annex 4-4: Guideline of Fire Training and Equipment) and training program for involving brigades and staff and residents. Location of the Fire Station will be in public facility of the initial township, as shown in Figure 1.3-17.

Source: DRC (2017)

**Figure 1.3-17 Illustration of Fire Station**

Number of fire trucks, pumper trucks, fire equipment are planned to develop in concordance with phases of the Township and number of population growth in the initial township (Table 4.1 14, Chapter 4). These amounts of the Project's resource is evaluated to be sufficient in controlling Tier 1 level of emergency (Controllable case with in the plant or the factory) and Tier 2 level of emergency (Controllable within the Township). However if a severe emergency occurs (Tier 3 level), which is unable to control by the Project resource and potentially extend and impact beyond the Project area (See Section 4.1.10.1), the Project will need support from local facilities or agencies, such as Fire Station and Fire Brigade team from the nearest town such as Yebyu Fire station.

#### Supporting Fire Stations

Yebyu Fire Station is located in the Yebyu Township, approximately 6 km from the Project. It is linked with the Township by good roads. The Yebyu Fire Station consists of medium fire brigade team (7 fireman) on shift 7/24 and 4 Fire trucks, 1 Fire tank truck, 1 Fire tank tractor, as show in Figure 4.1 48 to Figure 4.1 51. The Fire tanks can supply 30 liters per second and the tank trucks contains approximately 4,000 liters and the tank tractors contains 1,000 liters.

#### **(d) Assembly points**

The Project will provide enough assembly points to check number of residents before remove them out of the Township to safety areas. Ratio of the assembly point area must not be less than 0.25 sq. meter.

### **1.3.5 Emergency Response Plans**

According to IFC EHS Guidelines standard for community health and safety, the Project Proponent has prepared the Emergency Response Plans (ERPs) for cases of fires hazards both anthropogenic and fire vegetation or bush fire, natural disasters; earthquakes, tsunamis, flooding and landslides. As promulgated in the related laws and regulations, each plants / factories including the Project Proponent must form the reserve fire brigade team (Emergency Response Team) in order to manage emergency and co-ordinate in with several parties including preparation of fire apparatus and emergency equipment. Financial supporting for impacted communities during emergency is planned. Details in CSR of the Project.

#### **1.3.5.1 Emergency Level**

General emergency response plan of the Dawei Initial Industrial Estate can be categorized into 3 levels; Tier 1, Tier 2 and Tier 3 levels.

- Tier 1 level is a small scale of emergency that will occur in limited in area of residential or commercial buildings and incident can be controlled by supporting facility and team of the factory or the plant itself. The plants/factories have to perform the best in order to control and mitigate the impact. The incidents must be reported to the Initial Industrial Estate Emergency Response Center/Team.
- Tier 2 level is a medium scale of emergency that likely to extend to the other residential buildings in the Initial Township. However, the emergency trends to be controllable by supporting facility or facility of the Initial Township itself or nearby township facilities. The Initial Township commit to perform the best in order to control and mitigate the impact. The incidents must also be reported to executive of the Initial Industrial Estate or PIC for this level.
- Tier 3 level is a large-scale of emergency that likely to extend to the nearby community and surrounding environment. There need outsource supporting facilities and cooperation of nearby agencies in order to control and mitigate the impact. The incidents must also be reported to the Village or Township Administration or in charged Myanmar Departments.

#### **1.3.5.2 Fire and Explosive Plan**

Firefighting / Explosive plan consists of 3 stages; prevention, evacuation and recovery plans. Establishment of the buildings must comply code of practices which define in Myanmar legislation i.e. Building Codes and/or Notifications. The Initial Township shall have annual fire rehearsal, fire prevention system as defined in the said laws. In case emergency, fire and explosive plan must be proceeded accordingly level of the fire emergency.

#### **1.3.5.3 Storm and Flooding Plan**

Storm and Flooding plan consists of 3 stages; prevention, warning and evacuation and recovery plans. Drainage and flood retention system shall be prepared before storms and rainy season. In addition, follow up the meteoric condition and emergency announcement during flooding or rainy period shall be on action.

### **1.3.6 Occupational Health and Safety Administration**

The Project has formulated Safety Health Environment Master Plan in order to manage the Project, effectively under standards i.e. ISO14001, ISO9001 and OHS 18001. The safety plans are Permit to Work System (PTW), Personnel Protective Equipment (PPE), land transportation system, safety system during construction, preventive maintenance including health policy and measures; annual health checkup, drug check, smoking area, standard working condition and food. Standard for environment and waste management e.g. 3 Rs, waste separation and chemical handling. Details of the SHE master plan achievement in period of 10 years is in Annex 4.4.

### **1.3.7 Project Activities**

#### **1.3.7.1 Construction Phase**

##### ***(a) Construction of Infrastructure***

Preparation of the Initial Township area and infrastructure involves large quantity of earth moving and clearing of existing vegetation in the area. All the existing vegetation in the township area, except those within the green areas, will be cleared. Construction of utility systems and infrastructure is another major activity for the development of Initial Township. The construction will include necessary earthwork, concrete work, commissioning, and procurement of necessary equipment and machines for the following infrastructure and utility systems.

##### ***(b) Construction Work Camp and Workshop***

A main construction work camp which is used for accommodation of workers involved in the construction of Initial Township, is located at KM18 south of the main road. The accommodation is expected to support a maximum of 371 workers employed by Italian-Thai Development PLC., the main construction contractor of Initial Township. Area of 256,000 square meters is also used for facilities supporting the construction activities. In order to respond massive demand for housing, some precast raw materials, which are steel, cement and architectural materials (doors and windows), will be transported from Thailand by barges and trucks. The other construction raw materials e.g. sand and graded rocks will be supplied from local quarry in vicinity of the DSEZ.

##### ***(c) Transportation of Construction Materials***

Construction materials will be supplied from Thailand and will be transported through Myanmar-Thailand border at Kanchanaburi Province. The Main Road inside the township area will be improved and widened to accommodate the transportation of materials and machineries, which will be done mainly by dump trucks and trailers.

##### ***(d) Sanitation of Campsite***

Workers camp shall be constructed in accordance with Standard of the Engineering Institute of Thailand. Sanitary management for worker camp shall be in accordance with Standard and Layout for Temporary Construction Worker Camp issued by the Engineering Institute of Thailand Under H.M. the King's Patronage (Wor Sor Tor. 1010-34 Standard).

### **1.3.7.2 Operation Phase**

Operation of the Project will be by phases as described in Section 4.1.1.4. Activities during operation phases are following

#### **(a) Residential Activities**

As the Project will develop by phase, many activities related to living and playing in Township residential area will begin in small area of zone 9 plus 1 including public and green area within this zone. Afterwards, the residential activities will expand up to size of population that will move in to reside in the Township by phases; A, B, C and D, respectively.

#### **(b) Commercial Activities**

Commercial activities may start when some retail shops start operating their businesses. This is including establishment and operation of the commercial venue in commercial area that will start when suitable time arrive.

#### **(c) Traffic and Transportation**

Major transportation during operation will relate to routine travelling from residents' accommodation to their workplace e.g. the Initial Industrial Estate, plants and factories in DSEZ etc. Transportation of residents may be via private motor vehicles e.g. cars and motorcycles. Alternatively, public cars or buses may operate between Township and some spots in DSEZ including inside the Township and the Township and nearby towns.

Once commercial in Township expands, transportation of goods will start. Initially, traffic may not too congest due to design of road network system are still enough for loads of vehicles. However, due to construction of the other zone of Township will be developed in parallel of the operation, transportation of construction materials and equipment will share in some routes in Township.

#### **(d) Flood Protection**

The Project has designed Flood Protection System that can prevent the Project from flooding approximately for 6 hours (See details in Section 4.1.4). Rain water will be collected through drainages and canals underneath the Township. Operation of the system consisting of pumps and salute gates to hold and drain flooded water into Dawei River for the northern retention pond and into Kun Chung River for the southeast retention ponds.

#### **(e) Solid Waste**

As the population in the beginning phase is still small; thus, small volume of waste will be generated. The waste will be managed accordingly procedure described in Section 4.1.8.1 by the Initial Township staff and facilities. The non-hazardous waste will be collected, stored, delivered and disposed at the nearest disposal site and standard facility in Dawei. Hazardous waste and infectious waste will be stored in 200 drums or appropriate containers and will be transported to Yangon for suitable disposal at this stage.

Once the Waste Management System of Dawei Initial Industrial Estate starts operating, the waste will be disposed in these facilities according to procedure prescribed in Section 4.1.8 and Annex 4-3.

**(f) Wastewater Management**

Wastewater is preliminary treated by Onsite Treatment Units, which are installed in every buildings before draining to the Project wastewater treatment facility, resting ponds. The ponds will be operated when BOD of wastewater is excess 20 mg/L, over the effluent standard by NEQG (see Section 4.1.7). Pumps shall always be ready on duty and spare pumps shall be prepared for emergency and maintenance. Wastewater from northern resting ponds will be discharged into the Dawei River and wastewater from southern resting ponds will be discharged into the Kun Chuang River.

**(g) Fire Prevention and Emergency**

The Project will have an annual rehearsal of Fire Evacuation and Emergency for residents and related staff. This is an active safety, practicing activity for fire and emergency cases according to procedure prescribed in Section 4.1.10, Fire and Emergency Prevention Plan, which includes prevention, roles and responsibility of each parties and persons during the incidents, recovery and inspection.

**(h) Employment**

The Project will start employ local staff e.g. electricians, plumbers, gardeners and cleaners etc. for buildings and green areas management and operation and maintenance of the Township. Employment standard will follow the prescribed law and regulation in Section 3.2.3.3 of the said laws and standard of Occupational Health and Safety Administration in Annex 4.4.

**1.3.8 Description of Project Alternatives**

**1.3.8.1 The Project Site Selection**

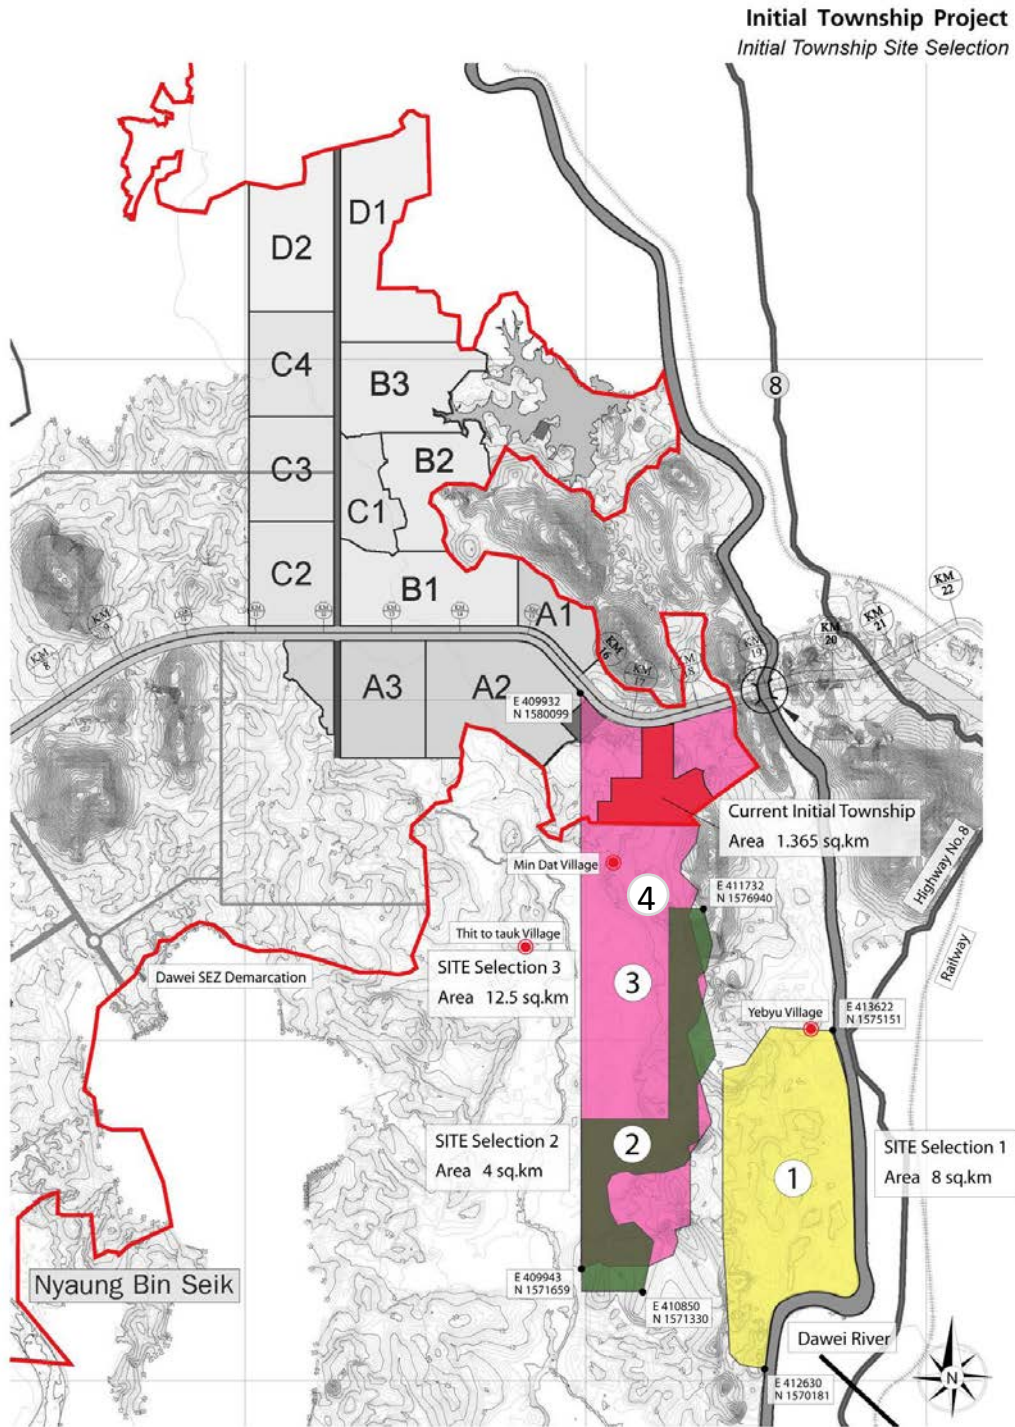

Four sites in DSEZ were selected for the Project alternatives.

**(a) Site No.1**

Total area of 8 square kilometers is flat and has two hill ranges surrounded along Dawei river. The site is potentially developed a nice-river side town and recreational park communities. However, three existing villages, Yebyu, Kyuak Htuak and Sin Pu Nit Villages will have to be relocated before the development including sub-sequential impact on the existing cultural and religious places on the hill. Nevertheless, the site is regularly flooded by Dawei River, up to 10 meters of the present level (From the Interviews, 2015). Lastly, to construct the Township, the site need to be upgraded for a distance of the accessed road, from the Main Road of DSEZ. The site can possible cost for transportation and life style and traffic congestion can possibly a problem.

**(b) Site No.2**

The total of 4 square kilometers has similar features as the previous site no. 1 but it does only have a distance from the Dawei river. Thus, the site will have lower impact from flooding.

Source: DRC (2015)

**Figure 1.3-18 Site section and Alternatives**

**(c) Site No.3**

The total of 12.5 square kilometers has similar feature as the previous site no. 2. The site is bounded by three hills, KaNyin Gauk, Tha Pye Zun and Ga Nan Taung and the demarcation line of the Dawei Industrial Estate in the south. The site is potentially developed as a nice mountainous community. However has one existing village, Min Dat village.

**(d) Site No.4**

The total of 1.365 square kilometers with maximum expansion up to 5.58 square kilometers is located in high terrain of the Dawei River. The site is bounded by the hill next to Dawei river in the northeast and agriculture area in the south. The site is connected to the Main Road of the DSEZ. The site has fan-shaped which can be design into multiple accesses in reducing traffic congestion at one access. The four alternatives had been evaluated by associated feasibility, several points of consideration and criteria by ITD; for example, impact on social and economy from relocation of villages and cultural places, location and accessibility, size and shape of the prospected Township, topography and aesthetic landform, flooding risk, incentive for land selling, transportation and traffic congestion, construction cost for infrastructure and obstacles for the development. Considering all of the above criteria, alternative No.4 has many advantages in size and shape area, location as accessibility, less impacts on cultural, social and economic impacts and construction cost than the others. Therefore, site no. 4 is selected as the most appropriate location of the Initial Township.

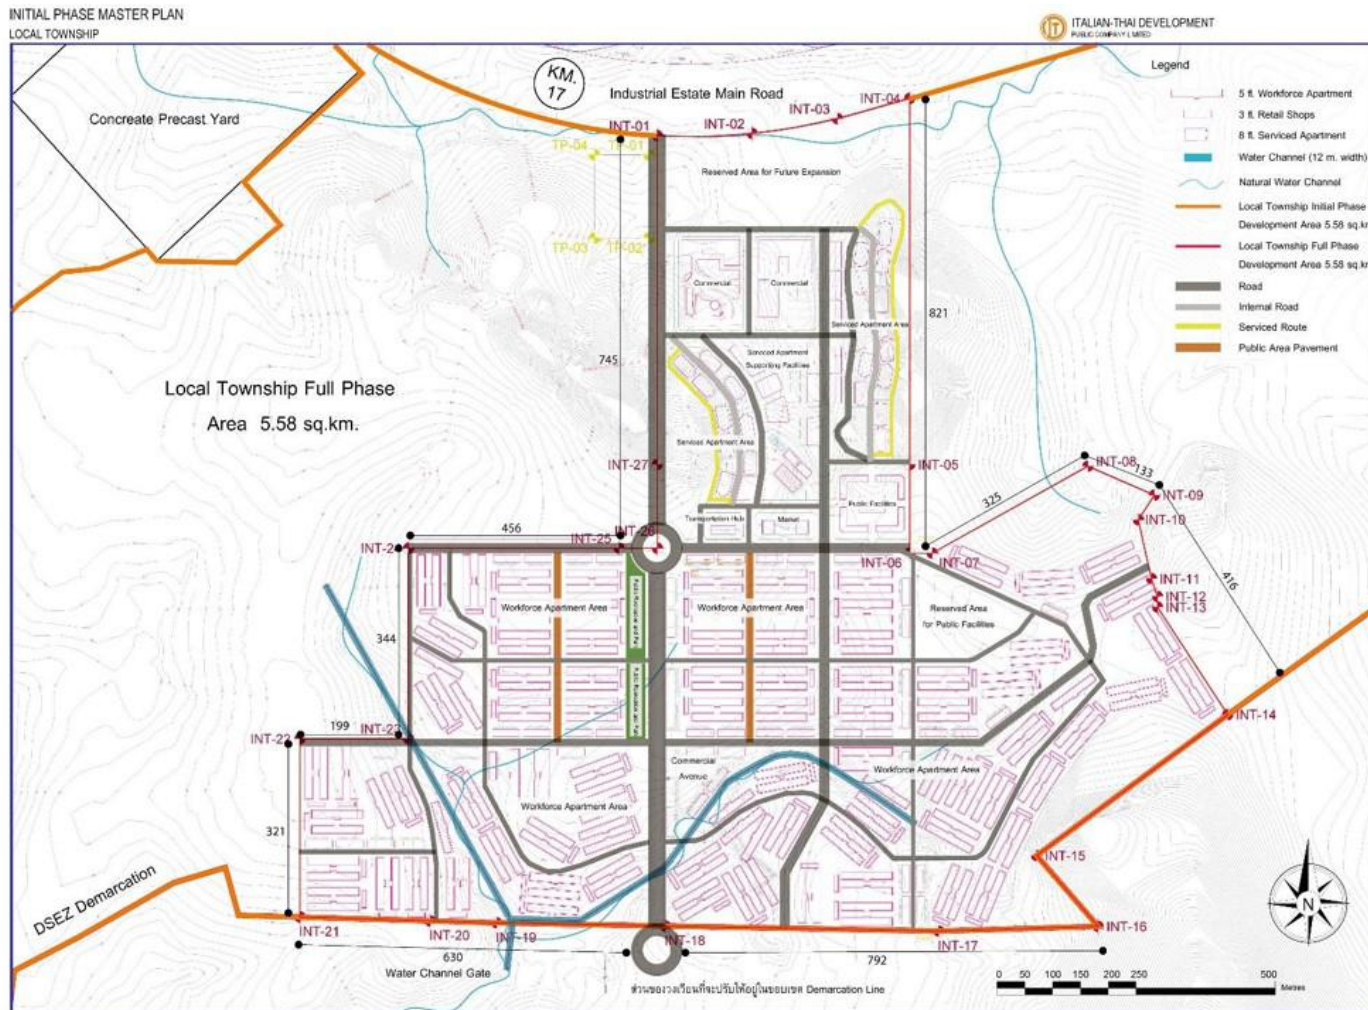

**1.3.8.2 The Project Final Layout (Master Plan)**

Upon selection of the appropriate site provides master plan of the township for the Site No.4 (Figure 1.3-19). The estimated project area in full phase of 5.58 square kilometers and area of the initial township is 1.365 square kilometers (Table 1.3-4). The original master plan was revised to the recent development and fitting in the recent concept of the Project with further designs in details on infrastructure and utility. The Final master plan is presented in Figure 1.3 3. The selected site and the final master plan was the one selected for the assessment of potential impacts in this EIA report.

**Table 1.3-4 Features of the Township final master plan.**

Description	Updated Master Plan Area (km <sup>2</sup> )
Commercial / Retail Shop	47,234 sq.m (0.047 sq.km)
5-floor Workforce Apartment	284,175 sq.m (0.284 sq.km)
8-floor Serviced Apartment	67,500 sq.m (0.068 sq.km)
3-floor Retail Shops	103,275 sq.m (0.103 sq.km)
Recreation / Sport	36,354 sq.m (0.036 sq.km)
Green Area	557,121 sq.m (0.557 sq.km)
Road / Traffic Route	222,885 sq.m (0.223 sq.km)
Initial Facilities	46,546 sq.m (0.047 sq.km)
<b>Total</b>	<b>1,365,000 sq.m (1.365 sq.km)</b>

## **1.4 DESCRIPTION OF THE ENVIRONMENT**

### **1.4.1 SETTING AND STUDY LIMITS**

#### **1.4.1.1 Geographical Study Limit**

The geographical study limits is defined as an area surrounding the project site from which the baseline information collection should be collected. In this Scoping Study, the geographical study limit is about 5 km extending from the center of the project site. This geographical study limit covers 78.57 km<sup>2</sup> of circular area around the project site as shown in a map in Figure 1.4 1.

#### **1.4.1.2 Contextual Study Limit**

The EIA guideline defines the contextual study limit to consist of four groups of components: (i) physical components; (ii) biological components; (iii) socio-economic components; (iv) cultural components.

### **1.4.2 PHYSICAL COMPONENTS**

#### **1.4.2.1 Topography**

The project area is comprised almost entirely of flat plains. There are 4 rivers running from the North to the South of the project area. The 4 rivers are: Nabule River; Dawei River; Kunchaung River; and Pan Din In Chaung River.

#### **1.4.2.2 Geology**

The project area is located in Q2-alluvial (Holocene), with reference to the Geological map of the Socialist Republic of the Union of Burma (USACE, 1977). There is fine to coarse gravel and sand, silt, and light-to medium-gray and yellowish-gray clay.

#### **1.4.2.3 Seismology**

The project area located in Zone I (Zone of minor damage). A range of ground acceleration less than 0.075 g.

#### **1.4.2.4 Tsunamis**

There was no observed major shoreline damage along the Dawei coast in terms of large areas of sediment loss or accretion.

#### **1.4.2.5 Hydrology**

There are four main rivers near and within the project area Dawei River, Nabule River, Kunchaung River and Pan Din In Chaung River.

#### **1.4.2.6 Air Quality**

There are 4 stations (near project area) for air quality measurement from the previous studies:

- The concentration of TSP and PM<sub>10</sub> average 24 hours were quite high, especially during the dry season.
- The concentration of SO<sub>2</sub>, NO<sub>2</sub> and CO were within the World Bank Group, U.S.EPA and WHO standards.
- The THC, MHC and NMHC were measured in preparation of baseline data, even though there were no standards given.

#### 1.4.2.7 Noise and Vibration

The L<sub>Aeq</sub> 24 hours and L<sub>Amax</sub> data, both dry and wet seasons, are within the U.S.EPA and Thai standards; The results of vibration found that the Peak Particle Velocity did not affect any building more than 2.0 mm/s.

#### 1.4.2.8 Groundwater Quality

Sampling on 2 and 14 March 2015 in 2 sampling stations near project area. All complied with standard excepting lead. Lead is one of the elements in nature. It can be found in water as well as in soil, rock.

#### 1.4.2.9 Surface water quality

Sampling on February 2015 in 5 sampling stations near project area (3 stations in water resources near the project area and 2 stations in Dawei River). Most of parameters complied with the proposed surface water standard. At SW1 in Ekani River that be located in the north part of the project has 5.8 mg/l of DO, low quantity of solids, 0.0002 mg/l of total mercury. While water sample at SW2 in Yalai Chuang creek, that be located in the south part of the project, found that yellow color and clear in physical characteristic, chemical characteristic analysis results are 4.2 mg/l of DO and low BOD and COD. In Dawei River, had high DO concentration (nearly 6 mg/l) and suspended solids ranged in 1,417 – 1,836 mg/l. whereas coliform bacteria and E. coli were found in both samples.

#### 1.4.2.10 Sediment quality

Most of parameters complied with the proposed surface water sediment standard; excepting mercury in every sampling station. Sediments of SW1 and SW2 were mostly sand (54.9 and 44%, respectively) and some heavy metals quantity were found. For SW3 station, the sediment was mostly clay (58.39%) and high concentration of mercury and iron (0.719 and 26,078 mg/kg, respectively). Physical characteristics of sediments in Dawei River from SW4 and SW5 indicated that the sediments of both stations were mostly clay (47 and 63.7%, respectively). Noted that most of heavy metal concentrations detected in sediment were arsenic, zinc, copper, iron, lead, nickel and total chromium.

### 1.4.3 BIOLOGICAL COMPONENTS

#### 1.4.3.1 Aquatic Ecology and Fisheries

- Green Algae and Diatom was the dominant taxa of phytoplankton, As indicated by Wilhm and Dorris (1968), the diversity index (H') is related to surface water quality. Diversity index results imply that the

water quality of water resource near the project area was at moderate conditions and acceptable for aquatic organisms.

- Nauplius of Copepod and Arcella protozoan were the most abundantly found.
- Segmented worms were dominant benthos in all stations. Littoral Fauna
- Freshwater shrimp was dominant of littoral fauna in all stations.
- *Actinoscirpus grossus* (coarse bulrush) were dominant in freshwater zone station, *Acanthus ebracteatus* (sea holly) and *Nypa fructicans* (nipa palm) were dominant in tidal zone station (Dawei River).
- Cyprinid fishes (Cyprinidae: Barb and Minnow) and Gobiidae (Goby) were dominant. Total density of fishes ranged 1,400 to 4,400 individuals/hectar and total abundance of fishes ranged 6.795 to 8.510 kg/hectare.
- Fisheries Activities: Pushnet boats, gillnet, fish trap, dip net, fish net and hook are small fishing gear that used by fishermen.

#### 1.4.3.2 Forests

The types of forest around the project area can be divided into 3 forest types: mangrove forest, reserved forest, and natural forest. In mangrove forest, one species is in the IUCN Red list: *Ceriops decandra* in reserved forest, none of the species in the study area are assessed in the IUCN Red list and in natural forest, one endangered tree species is *Diospyros crumentata*. Two critically endangered species are *Dipterocarpus kerrii* and *Dipterocarpus turbinatus* and one valuable species is *Hopea odorata*.

#### 1.4.3.3 Wildlife

Around the study area can be described in 4 types: reptile; amphibian; avis (birds); and mammal. For reptile, the burmese python (*Python molurus bivittatus*) is an endangered species listed in the UCN Red-list. For Mammals the east asian porcupine (*Hystrix brachyuran*) and long-tail goat (*Naemorhedus caudatus*) were listed under vulnerable species in the IUCN Red-list.

#### 1.4.4 SOCIO - ECONOMIC COMPONENTS

- Number of population, there are 5,834 households in 18 villages and number of population is 35,443 that divided into 16,628 males and 18,805 females. The highest population is at Pagaw Zoon village (7,700) while the lowest population is at Nyaung Bin Seik village (328).
- No data about ethnic group in 18 affected villages due to REM's village survey in 2013.
- The education system in Myanmar is divided into 4 levels; pre-school education, primary education, secondary education, and higher

education According to field survey each village has one school excepting Kya Khat Tabin in village which has two schools.

- Land use in Yebyu,, the area is still mostly unoccupied as only about 12 percent are active agricultural land while about two-third are forest land and in Laung Lone, one-third of total area is utilized for agricultural purposes while nearly two-third of the area is not utilized .
- 2 rural health centers with health assistance and a senior blue nurse (LHV Lady Health Assistance) in Lae Shaung and Pan Din In village.
- 70.8% of people have smoke tobacco and 12% of people drink alcohol regularly.
- Main source of food of the respondents was from the self-plantation (84.72%) followed by buying from market (9.94%) and natural resources/fishery/forest/river (5.56%).
- Water supply in the study area, is the shallow well. Other sources of water, for local villages, are from artesian wells and rain fall. Most households, in the affected villages, have good water source from shallow wells and streams in the Bawah village.
- Drinking water quality is in good condition around the project area More than 50% of the villagers use the filter treatment and 26.5% boil water before consumption.
- No electricity supply system. Only some households generate electricity from small generators.
- In the project area, the main generators are used for electricity generation during construction.
- In the Dawei area, does not have proper management on solid waste and sanitation. The results of field survey also indicate that public health services in local communities are quite limited. For household wastewater management, most of the respondents discharge wastewater to the ground (82.2%), followed by discharge to public drainage system (5.9%), discharge into the garden (5.1%) and discharge to the public river (4%).
- Solid waste disposal, most of the respondents manage by open burn (93.8%), followed by pile up outside the house (2.7%), landfill (2.2%) and throw away to pubic area (0.8%).
- The roads in the project site and local villages are unpaved surface about 4 m width.
- Transportation: for land transportation, only one main road within a five km. radius from the complex zone. Highway no.8; which is a two lane, for air transportation, there is a local airport at Dawei. All international flights are operated by Myanmar Airways International. Air Mandalay, Air Kanbawza, Asian Winds, Air Bagan and Yangon Airways are for domestic passengers. Flight time from Yangon to Dawei is about one

hour. For railways, Dawei-Yay railroad is running through Yebyu Township in the North-South direction parallel to the Dawei - Yay Highway. For water transportation only cargo boats utilize the Dawei jetty.

- Landuse: from landuse survey provided by the survey team of Italian Thai Development Plc. On site, there are three major types of land use on and around the project area.
- Agricultural Land: Flat plains are, for the most part, extensively cultivated with crops and paddy fields. Plantations are found on the higher ground, the lower parts of the ridges. Major types of plantations are oil palm, cashew nut, rubber, and some are coconut and betel palm.
- Forest Land: Deciduous forest still covers the mountainous area where they are not easily accessible or with steep slope.
- Rural Settlements: There are 16 villages in the project area.

#### 1.4.5 CULTURAL COMPONENTS

The village profile survey by REM (2013) found “Foot Print of Buffalo Pagoda” in Payadat Village and “*Nabule Settawyar* or *Buddha Foot Print*” in Lae Shaung Village. Moreover, there is one monastery in Mudu Village and two pagodas (one in Min Dut and the other in Pan Din In Village).

### 1.5 IMPACT ASSESSMET METHODOLOGY AND APPROACH

#### 1.5.1 Impact Assessment Methodology

This topic provides assessment of potential impacts to the environment due to project activities. The assessment of potential impacts is conducted on key physical resources, ecological resources, economic development and social and cultural resources, using quantitative approach wherever possible.

##### 1.5.1.1 Impact Assessment During Construction Phase

###### (a) *Physical Components*

###### Air Quality

Potential impacts to the air quality during construction activities are dust generally from unpaved transportation routes, construction site and cleared land. Impacts caused by the above activities are commonly localized to the area close to the source during construction period. This is moderate adverse impact.

###### Noise and Vibration

Some construction processes generate noise i.e. impact pile driving or pavement breaking. For noise assessment, construction equipment can be considered to operate in two

modes, stationary and mobile. The predicted noise levels in the distance of 100 ft. (33 m.) to 3300 ft. (1000 m.) from construction equipment sources found that the selected noise source emission levels range from 85 to 101 dB(A) which covers all the noise emission. The highest noise source is 101 dB(A) from pile-driver (impact type) and the estimated noise level is 70.6 dB (A) at 1650 ft. (500m.)

Therefore any noise source lower than 101 dB(A) will result in noise level lower than 70 dB(A) at 500 m. However the community in the distance of less the 500 m may be affected from noise when comparing to the measured Leq 24-hr (45.9 - 55.4 dB(A)) of station A2 and A6 .Construction within 500 m from the any sensitive receptors have to be controlled either by restricting the construction to day-time only, or an agreement has to be made with the nearby villagers should extended working hours are needed. This is low adverse impact.

The result of construction activities is various degrees of ground vibration depending on the equipment and methods employed. Ground vibrations from construction activities do not often reach the levels that can damage structures, but they can achieve the audible and feelable ranges in buildings very close to the site. Construction vibration may be generated from blasting, pile-driving, vibratory compaction, demolition, and drilling or excavation in close proximity to sensitive structures. Overall impacts due to vibration from construction equipment are expected to be negligible.

#### Topography and Soil

Changes and impacts to the topography during the construction are expected to be quite small. Soil piling on the project area will be careful about soil erosion and collapse. This is low adverse impact.

#### Surface Water and Sediment

The land development of the Initial Township area, may result in increased sedimentation in surface water from surface runoff in rainy season. Control of sedimentation from the construction sites will be required during the period to reduce release of sediment to the waterways. Vegetation clearing will only be conducted to the area that is needed for construction activities. Control measures such as sedimentation pond and silt fence will need to be constructed to reduce sediment loading to the natural waterways. Potential impacts due to sediment during construction will be limited in the construction period only. Local villagers rely on surface water for agricultural purpose, and water for consumption is sourced from shallow groundwater well. Therefore, impacts to the use of water are expected to be quite limited and short-term.

Domestic wastewater generated from the construction work camps are another source of pollutants to the waterways. Approximately 29.68 m<sup>3</sup>/day of domestic wastewater from the main construction camp is estimated, based on an assumption that the wastewater is generated at the rate of 80 liter/person (The accommodation is expected to support a

maximum of 371 worker employed by Italian-Thai Development Plc., the main construction contractor of Initial Township). Toilets in these camps will be provided with septic and seepage tanks. The location of these tanks will need to be at least 100 m from natural waterways and above expected flood level in the area. This is moderate adverse impact.

#### Groundwater

The project activity that may result in impact to groundwater quality is the waste management facilities where sanitary and secured landfills are located. Groundwater monitoring program will be required particularly for the waste management facilities. Considering that the project location is a low-lying land surrounded by mountain ranges and that the hydrogeological gradient is likely to be drained into the coastal area and is unlikely to be connected with groundwater system of the resettled communities, when the project is fully developed, the impact to groundwater use is considered limited. This is low adverse impact.

#### Solid Waste

Approximately 371 kg/day of non-hazardous waste from the main construction camp is estimated, based on an assumption that the non-hazardous waste is generated at the rate of 1 kg/person/day with a total numbers of workers at 371 persons in the camp. While the amount of hazardous wastes such as used oil, waste paints, machinery lubricants and other items could be estimated at 3% of municipal waste, was estimated at about 11.13 kg/day. The disposal of non-hazardous and hazardous waste is to use the service of Initial Industrial Estate landfill. There is suitable management system and no discharge through Dawei River. This is low adverse impact.

#### Geology and Seismology

According to the review of baseline information (Chapter 4), the project area located in Zone 1, minor damage, which is the range of ground acceleration less than 0.075 g, which is equivalent to MMI class V and less. Also, the seismic records indicated that none of earthquake situation in Dawei and project area. Although the risk is considered low, the project may consider cooperating with the local authority in updating and exchange of the seismological information. This is low adverse impact.

### **(b) Biological Components**

#### Surface Water Biology

The surface runoff will increase sediment into the surface water resources increasing levels of turbidity and suspended solids affecting photosynthesis of phytoplankton and productivity of water resources. Mitigation measures controlling release of sediment from construction sites need to be implemented to limit the amount of sediment being released to the environment.

Wastewater from construction work camps may result in degradation of water quality and dissolved oxygen. Use of seepage tanks and selection of location of the tanks away from the natural waterways will help reduce the potential impacts.

Used oil from equipment maintenance and workshops may be effected to aquatic organism. It is recommended that the used oil are kept temporarily on site in a proper storage area will help reduce the potential impacts to aquatic life. These are low adverse impact.

#### Terrestrial Ecology

The natural forests in the area designated for Initial Township have long been encroached by local population and used as farmlands and villages but it still exist in many parts of the area. Wildlife found in the project area in the previous studies is mostly common. It is mostly disturbed by human activities and does not offer good feeding ground and habitats.

During construction phase, clearing of vegetation is unavoidable, but impacts can be reduced through mitigation measures. These are low adverse impact.

### **(c) *Economic Development***

#### Infrastructure Facilities

Since groundwater and diesel generators or the LNG power plant will be the source of water and electricity in the camps; therefore, there is no impact on existing water use and electricity generation of the local villagers. And appropriate management facilities are identified, hazardous waste needs to be stored temporarily until the waste management facilities are operational. Disposal site for non-hazardous waste to be used during construction phase needs to be established. It is beneficial impact.

#### Traffic and Transportation

The volume of traffic from smaller vehicles, such as pick-up trucks, is expected to be higher than the period before the project, thus increased risk of accident between the vehicles used in the project and motorcycles, which is the most common transportation mean of the local villagers. However, the project will install sign boards along the roads that most frequently used by the project's vehicles to reduce the risk of accidents. It is low adverse impact.

#### Land Use

Major concerns related to high adverse impact on land use during construction period, it is important such temporary service activities and structures set up for workers' needs be planned out monitored regularly. Relocation may be needed in intervals as appropriate so that eventually most or all services for project personnel will not be allowed to scatter outside the designated township zone.

#### **(d) Social and Cultural Components**

##### Socio-Economic Conditions

Lack of knowledge of project activity and planning is one of the key concerns received from the public consultation activities. This may lead to negative rumors and misconception of the project. Concerns of the public can also be collected and addressed during this routine engagement. The Dawei Special Economic Zone Law requires that the factories employ Myanmar people at a certain percentage of all workforces every year (a beneficial impact). Despite this requirement, if the knowledge and skills of local villagers do not meet the requirements of the industries, the industries will have to employ Myanmar people from other regions such as from Yangon resulting in lost opportunity for the local populations. Career training and workshop aiming to improve skills of local populations need to be established to prepare them for future employment in the industrial estate since the construction phase.

##### Sites of Historical and Cultural Importance

There are three sites of high historical and cultural values i.e. NabuleSettawyar or Buddha Foot Print (Laeshaung Village), the monastery (Mudu Village), and Pagodas (Min Dut). These sites are within the project area and will require careful planning as to how they are maintained or relocated. Religious places are highly important in Myanmar and potential impacts due to mishandling of these sites and insufficient engagement and acceptance with local villagers and authorities are considered high. Therefore, this is moderate adverse impact.

#### **(e) Public and Occupational Health**

Potential sources of impact to public and occupational health conditions during construction phase are discussed below:

##### Occupational Health and Safety

##### **Accidents and Injuries:**

Accidents and injuries will be notable for workers, especially among untrained ones. The wide range of injuries may be found from minor or medical aid required only to serious cases, disabling injuries and/or death. Faulty electrical devices, blunt injuries, cut wounds, falling, as well as eye irritation and burns are common, however, broken limbs, trauma and or serious injuries can also occur. Besides, increased number of traffic accidents can be expected. Therefore, the prevention and mitigation measures need to be provided.

##### **Occupational, Sexual Transmission and Communicable Diseases:**

Potential respiratory diseases may be aggravated, due to pollutants exposure in the workplace, such as dust, exhaust gas, chemicals or solvents. Underlying chronic diseases: asthma, allergy, peptic ulcer, or mental disorder, can be exacerbated by the exposure of hazardous/chemical wastes. Moreover, unhygienic habits, poor personal hygiene and environmental sanitation, may possibly increase diarrhea, hepatitis and communicable diseases. Malaria and dengue fever and local disease from the affected area, can be easily

spread. Sexually transmitted disease and HIVs are also expected and needed to be seriously concerned to designate prevention and control measures.

### ***Emergency Response and First-Aid:***

Fire may occur from ignition of flammable materials or other reactive chemicals which can lead to accident and injuries as well as loss of properties. Thus, emergency response plan dealing with fire, explosion and chemicals leaks should be established. Dawei Residence (Myanmar), as the project owner, has provided the first-aid unit in the campsite at all times. The qualified first-aid units should also be established to ensure that can properly handle with serious or trauma cases. Patients should be taken care and transferred to appropriate medical facilities in time.

### ***Community Health***

The project activities during the construction phase possibly have certain impacts beyond the project boundaries. Communities around the project area may be affected in various issues.

### ***Housing and Sanitation:***

This will create pressure on public health services, public health facilities, and sanitation. Currently the public health services provided by local authorities are rather limited. Improper management of sewage, wastewater and solid waste may generate sources of diseases. Therefore, the sufficient infrastructure amenities and services should be provided, e.g. solid waste disposal, to mitigate the impact.

### ***Environmental Communicable Diseases:***

According to construction activities and transportations, communities will be exposed to excessive dust and noise that can lead to increase of respiratory diseases and nuisances.

Due to mobility of workforce, sexually transmitted diseases, such as HIV/AIDS, will be the most concerned communicable diseases. These diseases can be spread widely. Increasing of malaria, dengue fever, dysentery, hepatitis, pneumonia, and tuberculosis is also expected due to the poor sanitation.

The migrated workers may bring emerging diseases to the project area. If this happens, local villagers will be likely exposed to new strains of diseases. Common cold and flu as well as respiratory tract infection caused by probably new strains are also possible. An increase of alcoholic drinking, smoking and substance abuse and increasing of migrated labors, violence and social disturbance are expected as well. Appropriate mitigation measures should be implemented to reduce these impacts that may occur.

### ***Accident/Fire/Chemical Leaks:***

Accidents may occur while transporting construction materials and supplies including chemicals such as gasoline, solvents or lubricants. These accidents will lead to

releases of hazardous materials that may result in fire, explosion and/or toxic chemical leaks into the environment. Thus, the emergency response plan should be established.

### ***Adequacy and Readiness of Healthcare Services:***

Local healthcare services and healthcare personnel, in quantitative and potentiality dimension are quite limited at present. However, the injuries and illness will be increased in term of quantity and complexity. The mitigation measures should be, therefore, provided to reduce pressure on the healthcare facilities.

## **1.5.1.2 Impact Assessment During Operation Phase**

### ***(a) Physical Components***

#### Air Quality

During operation period, the activity that may create air pollution is exhaust from vehicles. Air pollutant suppression methods, such as planting trees around the boundary at ground floor, will be required to increase shady area and reduce heat including the CO<sub>2</sub> absorption to reduce pollutants from exhaust. This is low adverse impact.

#### Noise and Vibration

The operation has no noise and vibration impacts on nearby area.

#### Topography and Soil

After construction finished, it has no impact in operation phase.

#### Surface Water and Sediment

Estimated wastewater volume in onsite wastewater treatment plant at each building and polishing ponds is followed. Wastewater treatment plant is separated into 2 zones i.e. north zone and south zone. At the north zone, wastewater per building generated from building with capacity as 15 m<sup>3</sup>/day (150 m<sup>3</sup>/day from 10 buildings) is prepared for treated wastewater from 3-floor workforce apartment, 84 m<sup>3</sup>/day (1,512 m<sup>3</sup>/day from 18 buildings) is prepared for treated wastewater from 5-floor workforce apartment and 27 m<sup>3</sup>/day (162 m<sup>3</sup>/day from 6 buildings) is prepared for treated wastewater from 8-floor serviced apartment. Total wastewater volume from north zone is 1,824 m<sup>3</sup>/day.

At the south zone, wastewater per building generated from building with capacity as 15 m<sup>3</sup>/day (780 m<sup>3</sup>/day from 52 buildings) is prepared for treated wastewater from 3-floor workforce apartment and 84 m<sup>3</sup>/day (13,272 m<sup>3</sup>/day from 158 buildings) is prepared for treated wastewater from 5-floor workforce apartment. Total wastewater volume from south zone is 14,052 m<sup>3</sup>/day. BOD of effluent will be not exceed 20 mg/l complied with the notification of the Ministry of Natural Resources and Environment in the topic of wastewater standard from wastewater treatment of community. Effluent will be discharged to public drain and through Dawei River. Therefore, the project operation phase will not generate the pollutant to impact on surface water quality. This is moderate adverse impact.

However, before starting the initial phase of Initial Township, there will be construction of nine 5-storey buildings and one 5-storey building for project's workers and officials; impact on surface water is also less than impact of full phase operation due to less capacity or less population (maximum 700 persons/ building in 5-storey building and maximum 222 persons in 8-storey building). Discharge point is Kunchang River only.

### Solid Waste

Solid waste generated during the operation period can be divided into 3 parts i.e. non-hazardous waste, hazardous waste and infectious waste. Non-hazardous waste and hazardous waste will be appropriated with disposal. For infectious waste is transferred to incinerator for disposal. There is suitable management system and no discharge through Dawei River. Therefore, it has no solid waste impact.

## **(b) Biological Resources**

### Surface Water Biology

Treated wastewater will be discharged through public drainage system without discharge through public water resource. Therefore, the project operation will not create impact on surface water quality and freshwater aquatic organisms.

### Terrestrial Ecology

Direct impacts to terrestrial ecology during operation phase are expected to be small as the environment would have been altered since the construction phase due to influx of workers to the industrial area and live in Initial Township, demand of wildlife meat and parts may be increased resulting escalation of wildlife poaching and hunting in more futile reserved forests elsewhere. Education and discouragement of consumption and domestication of wildlife need to be conducted all through the project life.

## **(c) Economic Development**

### Infrastructure Facilities

During operation phase, sources of raw water will be from small water reservoir (Pa YainByu and TalaingGya Weir). The raw water will be delivered to the water treatment plant located near the reservoir before delivered to Initial Township. Electricity will be generated by the power plants inside the industrial estate. Waste from Initial Township will disposal at waste management facility in Township.

Overall, it is expected that there will be no impacts from the project to the existing infrastructure facilities of the local communities.

### Traffic and Transportation

The Initial Township grid system has been designed into fan-shaped grids with multiple town accesses which will prevent traffic congestion at one access. For the workforce areas, the grids are equally divided the blocks into walking distance to make sure the workers can get off the bus and continue walking to their homes conveniently. In the gated type community such serviced apartments, there will be only one or two accesses to increase both privacy and safety to residents. Public lighting and drainage system will be applied along the grid.

### Land Use

Potential negative impacts on land use are predicted to affect the town of Dawei also. As the project is in operation, there will be needs for services other than those day-to-day services that can be provided within the township zone of the project. Naturally, it can be predicted that the town of Dawei, with certain level of infrastructure and social services, will grow rapidly to accommodate requirements of project personals such as, residences for the supervisors or consultants who prefer not to stay within the estate, business clients and guests who visit the project estate shortly for specific purposes, or other workers who perform services to the project personnel but are not allowed to stay in the township zone. Dawei will also provide entertainment activities for the workforces when off-duty on the weekend. These sometimes undesirable uses are not allowed in the township zone of the project but will find their places in the town. Zoning and control for such entertainment district should be laid out ahead of time for the town of Dawei.

## **(d) Social and Cultural Components**

### Socio-Economic Conditions

Issues related to the socio-economic and social issues during operation phase are similar to the construction phase.

### Sites of Historical and Cultural Importance

If the handling and relocation of historical and cultural places during construction phase is performed properly, potential impacts during operation phase is not expected.

### Public and Occupational Health

Potential sources of impact to public and occupational health conditions during construction phase are discussed below:

### **(e) Occupational Health and Safety**

#### Sexual Transmission and Communicable Diseases:

Sexual transmission diseases and vector-borne infection are mostly related to poor personal hygiene and poor sanitation. Foreign or migrated workers who live in Initial Township are possibly exposed to local diseases, malaria and dengue fever. Strict prevention and control measures as well as health care promote for living.

#### Adequacy and Readiness of Healthcare Services:

Regarding the significant numbers of workers in the project area, a hospital/healthcare facility located in the project township will be established. This newly established healthcare facility should be the comprehensive one, in term of adequacy, capability, and accessibility since at present public health facilities and services provided by local authorities are quite limited.

### **(f) Community Health**

#### Sanitation:

Increasing of supporting industries and surrounding areas will have pressure on adequacy of infrastructure amenities and services, as well as public health facilities. Improper management of sewage, wastewater and solid waste may lead to poor sanitation and environmental health stresses. Currently, public health services of the local authorities are limited therefore the project owner should closely collaborate with the local authorities to create the mitigation measures to prevent the consequences that may occur.

#### Environmental, Communicable/Non-Communicable Diseases:

Spread to the local residents, especially in the area with poor hygiene practices. Sexual transmission diseases, HIV/AIDs, and communicable diseases are associated with mobility of workers.

Higher public incomes may result in unhealthy habits e.g., low nutritious food, alcohol drinking and less exercise, which may cause chronic health problems: hypertension, diabetes, heart disease, stroke and cancers. More alcohol consumptions and smoking will be normally found. In fact, these non-communicable diseases will be serious problems, and need a sophisticated approach for the solution.

#### Adequacy and Readiness of Healthcare Services:

Qualified healthcare services are needed due to an increase of illness, injuries, accidents and fatalities. The wide range of injuries and disabilities will create an excessive burden of health services. Consequently, the effective health surveillance system is needed.

## 1.5.2 Risk Assessment

Risk mitigation measures need to address the identified causes of the risk. Mitigation measures for the identified risks correspond to the identified causes are presented in Table 1.5-1. The measures will be implemented through contractual arrangement.

**Table 1.5-1 Mitigation Measures for Environmental Risk Management during Construction Phase**

Cause	Mitigation Measures
The ITD contractor and subcontractor have inadequate understanding of the environmental performance requirements of the project.	Require the ITD contractor to: <ul style="list-style-type: none"> <li>- Prepare a Construction Phase Environmental Management Plan (CEMP) base on the EIA report and associated CEMP, detailed design and construction plan and schedule. The CEMP must clear define.</li> <li>- The project's environmental requirements and obligation</li> <li>- Physical measures that are needed to comply with the requirements and obligation.</li> <li>- Construction measures that are needed to comply with the requirements and obligation.</li> <li>- Assignment of responsibilities to each subcontractors.</li> </ul>
The ITD contractor and subcontractor unintentionally omit the environmental requirements due to ambiguity of the environmental requirements in the contract.	<ol style="list-style-type: none"> <li>1. TOR for procurement of the ITD contract must clearly state the project's environmental requirements during the construction phase that the ITD contractor must ensure that the project construction will meet the requirements.</li> <li>2. The ITD contract must clearly prescribes environmental management responsibility of the ITD contractor.</li> </ol>
Inadequate supervision and monitoring of environmental mitigation activities of the ITD contractor and subcontractors.	<ol style="list-style-type: none"> <li>1. The supervision consultant will be required to submit a supervision and monitoring plan that clearly indicates the environmental tasks to be supervised and monitored. This supervision and monitoring plan for the implementation of the environmental mitigation measures.</li> <li>2. Monthly reviews of the ITD contractor environmental performance.</li> <li>3. Close supervision of truck operations especially during the site filling period.</li> </ol>
Changes in designs or construction methods without revising the originally proposed mitigation measures.	Changes in designs or construction methods may be initiated by the ITD contractor or the project proponent.  The request for changes must be subject to the change procedure in project management.  The request for changes must be accommodated by an analysis of environmental implications and revised mitigation measures.
Change in the environmental requirements during the construction without the revision of the originally proposed mitigation measures.	Change in the environmental requirements may be initiated by DRC or the project proponent with approval of DRC.  The change must be subject to the change procedure in project management.  The ITD contractor will analyze environmental implications of the changes and revise the originally proposed mitigation measures accordingly.

The operation phase of residential building has no risk activities. Therefore, the operation of Initial Township has no risk impacts on nearby area.

## 1.6 CUMULATIVE IMPACT ASSESSMENT

For the cumulative impact assessment is assessed in overall of Dawei Initial Industrial Estate in case of opening the all operation phase. A simple matrix can be used to identify and evaluate cumulative impacts. The levels of potential impacts are assessed qualitatively as in Table 1.6-1 that is shown the results of the evaluation.

**Table 1.6-1 Cumulative Impact Evaluation Matrix**

Potential Impacts Area	Proposed Action	Past Actions	Other Present Actions	Future Actions	Cumulative Impacts
<b>Physical Resources</b>

## 1.7 ENVIRONMENTAL MANAGEMENT PLANS

### 1.7.1 Scope of Environmental Management Plans

The key organizations responsible for implementation of the mitigation measures include: the Governing Bodies of the Government of Myanmar, the Project Owner, the Construction Contractor and sub-contractors during construction phase, and the Investors. However, it should be noted that the planning and development of the Project has been dynamic throughout the study period. This includes also the organization of the project and other relevant agencies. The information used as the based scenario is considered the most valid one at the time of the report preparation. Changes to the project information may occur

overtime and, therefore, readers and project implementers are advised to check and confirm the project details at the time of review and implementation.

### **1.7.2 Application of the Owner-EMPs**

The Project Owner for this project refers to Dawei Residence Company Ltd. (DRC), which falls under the category of 'Developer' according to Myanmar Special Economic Zone Law (2014). DRC roles in the project include design, construction, and operation of infrastructure and amenities in the Dawei Initial Industrial Estate. DRC will be responsible for technical planning, enforcing, and monitoring of all environmental mitigation measures as stipulated in the EMP. The Project Owner reports to the Governing Body.

Construction Contractor and sub-contractors (CC) refer to the Contractor and sub-contractors for the development of Initial Townships, which include constructions of utility systems (i.e. water treatment and distribution system, wastewater collection and treatment system, irrigation system, solid and hazardous waste management facilities etc.), internal roads, and basic infrastructure for the industrial estate. CC must operate in accordance with the mitigation measures stipulated in this EIA report. CC must report to the Project Owner.

### **1.7.3 Project's EHS Policy and Commitments, and Legal Requirements**

#### **1.7.3.1 Construction Phase**

During construction period, the Project is not expected to have major environmental impacts apart from environmental disturbances. Nevertheless, the Project Proponent will ensure that the Contractor will make best efforts to minimize the impacts during the construction phase despite their insignificant levels. In this regard, the Project Proponent will ensure that the Contractor-CEMP will incorporate all mitigation measures as prescribed in the Owner-CEMP in preparing detailed designs of the Initial Townships and its associated facilities, construction methods, and specifications.

#### **1.7.3.2 Operation Phase**

During operation period, DRC as the project owner has to establish the environmental policy and rules that will govern environmental practices and performance of the industrial estate as a whole. The establishment and implementation of this component is of almost important absence of local environmental regulations and authorities fully responsible for environment and pollution control in Myanmar. Once established, DRC shall adhere to these policy and rules. However, in the future, when the environmental protection laws may be announced and published by the Government of Myanmar, DRC shall ensure that the requirements as set in the policy and rules are fully in compliance with the laws.

### **1.7.4 Summary of CEMP and Arrangements for the Implementation**

#### **1.7.4.1 Construction Phase**

DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program can be

- each construction machineries are inspected at least every 6 months with a written certificate / maintenance records of each machinery provided by qualified mechanics of the CC,
- Inspect that the dust suppression measures are implemented according to the mitigation measures,
- Inspect that the burning of waste materials are conducted according to the relevant mitigation measures,
- Monitor the Community Grievance Record related to dust and noise and ensure that the complaints are responded to and closed appropriately according to the relevant mitigation measures.
- Additionally, it is recommended that the project continue sampling of ambient air quality in industrial area and nearby villages every 6 months, dry and rainy season.

#### 1.7.4.2 Operation Phase

There are 6 main potential impacts in operation phase. One of the main potential impacts to surface water quality during operation activities is wastewater and solid waste from the wastewater treatment and landfill. DRC shall formally notify CC and enforce the following measures to reduce the pollutants DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program can be

- Design and construction of the landfill shall be in accordance with Solid Waste Disposal Facility Criteria – Technical Manual published by U.S. EPA (1993) or other applicable standards.
- Detailed hydrogeological condition of the proposed landfill area has to be studied in the design of landfill.
- Groundwater monitoring wells will be installed. As a minimum, 1 well is to be installed up-gradient of the landfill and at least 3 wells is to be installed down-gradient of the landfill. Depth of screens and well construction depends on the results from the hydrogeological condition study.
- The components of the waste management facility i.e. sanitary landfill, secured landfill and incinerator shall be designed and constructed according to the internationally accepted standards.
- The facility shall create its Standard Operating Procedure covering steps from receiving waste, laboratory analysis, stabilization, temporary storage, incineration and disposal. Audit by third party is necessary.
- The landfill shall be closed daily to prevent vectors and odors.
- Classify hazardous and non-hazardous waste according to the definitions in the Waste Management Plan prepared.
- Workers need to be trained of Waste Management Plan.
- All hazardous and non-hazardous waste generated shall be transferred to the facility for disposal.

- Waste manifest system has to be created and implemented.
- Record of type of waste including its quantity shall be kept in the database of DRC.
- Waste Management Facility (if constructed in the landfill).

However, the mitigation for reducing the effects from main potential impacts both of construction and operation phase are discussed in **Chapter 8** in this report and in EMP Report.

## **1.8 PUBLIC CONSULTATION AND DISCLOSURE**

### **1.8.1 Purposes of Consultation**

The objectives of public participation and disclosure are

- to inform the stakeholders about the Initial Township project,
- to gain public views, concerns and values,
- to increase public confidence, and
- to improve transparency and accountability in decision-making process.

### **1.8.2 Public consultation**

The Project carried out 3 public consultation, the first one was conducted in 2013 (See Annex 9-1). The second consultation was conducted during 21<sup>th</sup>-22<sup>th</sup> March 2015 and the Third consultation was on 28<sup>th</sup> March 2018. All the consultation were held in Dawei SEZ and the impacted villages.

Key stakeholders such as regulatory authorities, private sectors, NGOs/CSOs and local people in Dawei SEZ were participated in consultation meeting. Main affected villages, Mindut and Pagaw Yun were also participated in attitude survey. Media and communication used i.e. presentation, handouts and attitude survey were conducted in Myanmar and by cooperation of local partner consultant, Resource Environmental Management Myanmar Staff.

Concerns, opinions and recommendations for the Project were different for each consultations. For the recent consultation on 28<sup>th</sup> March 2018, which was hosted by the Project Proponent, DSEZ Management Committee and Environmental Conservation Department, MONREC. The meeting was held in Dawei SEZ auditorium, in Dawei, Tanintayi region. Stakeholder groups in this meeting consisted of regional government, government officers, villagers and NGOs. Issues raised in the meeting were concerning land acquisition, job opportunities and likelihood restoration issues. Inquiries regarding project commitments and environmental management plan were also mentioned.

The result from every phases of the public consultation meeting were considered by the Project proponent and the significant social impacts/recommendation i.e. employment and training and public information etc. were embedded in the social mitigation measures, the Environmental Management Plan and the project's commitments. Example of public mitigation measure in construction phase is shown in Table 1.8-1.

**Table 1.8-1 Mitigation measures for construction phase**

<b>Mitigation Measures</b>	<b>Place</b>	<b>Period</b>	<b>Responsible Agency</b>
1. Inform head of villagers about construction plan and activities	<ul style="list-style-type: none"> <li>• 2 Villages</li> </ul>	<ul style="list-style-type: none"> <li>• At least 2 weeks prior to the construction</li> </ul>	MIE
2. Local people can complain about the project activities directly to the complaint handling unit or via the community leader. The corrective actions of each complaint must be done within a month or at the period of time that developer and local people mutually agree	<ul style="list-style-type: none"> <li>• Via community leader house</li> <li>• Putting complaint in the comment boxes</li> <li>• Oral inform at complaint handling unit</li> </ul>	<ul style="list-style-type: none"> <li>• Over construction phase</li> </ul>	MIE
3. Provide on-site construction skill training for local people and give them wages at least those indicated by Myanmar labor law	<ul style="list-style-type: none"> <li>• At the construction site</li> </ul>	<ul style="list-style-type: none"> <li>• On-site training</li> </ul>	MIE
4. Inform head of villagers about the operation plan and activities in the operation phase	<ul style="list-style-type: none"> <li>• 2 Villages</li> </ul>	<ul style="list-style-type: none"> <li>• At least once a month over operation phase</li> </ul>	MIE
5. Local people can complain about the project activities directly to the complaint handling unit or via the community leader. The corrective actions of each complaint must be done within a month or at the period of time that developer and local people mutually agree	<ul style="list-style-type: none"> <li>• Via community leader house</li> <li>• Putting complaint in the comment boxes</li> <li>• Oral inform at complaint handling unit</li> </ul>	<ul style="list-style-type: none"> <li>• Over operation phase</li> </ul>	MIE
6. Provide industrial skill training for local people	<ul style="list-style-type: none"> <li>• In the community to avoid difficulty of travelling</li> </ul>	<ul style="list-style-type: none"> <li>• On-site training</li> </ul>	MIE
7. Contract all tenants to give the first priority for local employment		<ul style="list-style-type: none"> <li>• Over operation phase</li> </ul>	MIE

Source: EIA Study Team

### 1.8.3 Information Disclosure

The project disclose information on the Myandawei Industrial website, which consists of project proponent information, facilities and infrastructure, download of the EIA/ESIA report including contact information.

#### **1.8.4 Recommendations for Future Consultations**

The major concerns obtained from the public consultation meetings included environmental pollutions from the project and their way of life after the project is implemented. Regarding environmental pollutions, the villagers are worried that the project might generate water pollutions and they cannot use water in the natural water sources. In additions, they villagers are worried about their occupations after the project is implemented. Thus, they need a train program that can help them work in the industrial sector. The villagers also need to know about the actual project schedule and project description. Since the information has been changed all the time, they feel uncertain about their future. The key recommendations from public consultations are to inform the villagers about project schedule, impacts, and mitigation measures to minimize the impacts from Initial Township as well as to provide appropriate training to the local people.

#### **1.9 RESETTLEMENT AND COMPENSATION**

Most of the Project area is palm plantation for agriculture belong to government. No land acquisition for the Township is required. Thus, none resettlement and compensation plan are required.

## CHAPTER 2 CONTEXT OF THE PROJECT

### 2.1 PROPOSE OF THE EIA STUDY

This proposed project entitled “*Initial Township*” (herein referred to as “*the Project*”) will be developed by Dawei Residence Company Limited (DRC). A 1.365 square kilometers of land in Dawei Special Economic Zone (DSEZ) will be developed a township that will accommodate workforce from industrial estate, growth of businesses and logistics trading in the DSEZ.

The Environmental Impact Assessment Procedure (No.616/2015) (hereinafter referred to as “*EIA Procedure*”), which was issued by the Ministry of Environmental Conservation and Forestry (MOECAF) (predecessor of Ministry of Natural Resources and Environmental Conservation (MONREC)) on 29<sup>th</sup> December 2015 defines the detailed legal process regarding EIA procedures including preparation of EIA/IEE report, environmental management plan (EMP), public involvement, approval of EIA/IEE report by MONREC, and monitoring process in accordance with the EIA report.

In this EIA Procedure, “*Tourism and Hospitality Development*” that is having a total area of accommodation more than 10,000 square meters or having more than 80 rooms are requested to conduct full EIA study. Therefore, the Project Proponent has to conduct the EIA study based on the EIA procedure.

### 2.2 RESENTATION OF THE PROJECT DEVELOPER

Development of the project aims to accommodate a high quality of residence with a range of facilities and recreations in order to raise living standard of workers both Myanmar citizen and foreigners. The Initial Township (Figure 2.2-1) is designed for maximum capacity of 135,080 peoples for the initial phase and planned to expand up to 370,116 peoples in full phase.

Several multi-stories of apartments including workforce apartment, service apartment, retails shops and commercial venues will be built including school, police station, health care center e.g. hospital. The project will be supported by shared facilities, between the project and the initial industrial estate, such as Solid Waste Management System e.g. waste collection, storage units and disposal landfills / incinerator and fire services.

#### 2.2.1 Project Background

The DSEZ is bounded by the Andaman Sea in the west and Dawei River in the east. It is located approximately 28 kilometers north of the Dawei province and can be accessed via both land vehicles and sea vessels. The DSEZ is planned to develop as a pivotal place for trading and transportation of South East Asia. The feature of DSEZ integrated standard infrastructure, light, medium and heavy industrial parks, port and logistics, water reservoir,

power and fuels e.g. LNG are aimed to boost national economy especially development in the Taninthary region, southern Myanmar, and employment opportunities for locals.

In 2010, the Italian-Thai Development Public Company Limited (ITD) signed a Framework Agreement with the Myanmar Port Authority for “*The Dawei Sea Port and Industrial Estate Development Project*”. The Framework Agreement granted the concession for the Project including the others several projects, which were a cross border road and rail link with connecting transmission line; and a township for residential and commercial.

In July, 2012, Government of the Kingdom of Thailand and Government of the Republic of the Union of Myanmar signed a Memorandum Of Understanding (MOU) on the comprehensive development of “*The Dawei Special Economic Zone (DSEZ) and its related project areas*”, in order to enhance cooperation of the two governments in development of the Dawei Projects; however, the Dawei Projects were suspended during 2013.

Later year in 2015, ITD had been granted the concessionaire contract to develop “*the entire DSEZ Industrial Estate-Initial Phase*” from the Myanmar Government. Due to the fact that scale of the new development was large and too complex. Thus, each component was spited into separated Environmental and Social Impact Assessment (EIA/ESIA) and Initial Environmental Examination (IEE). The environmental studies were assigned for the following projects:

- Two-Lane Road that connects between the DSEZ in Dawei and Thailand. The road is 138 kilometers starting from Phu Nam Ron in Kanchanaburi divided into 3 sections. Section 1 is 50.9 kilometers and section 2 is 42.9 kilometers and section 3 is 44.2 kilometers, respectively. Most of the road sections are in Myanmar, only 5 kilometers in Thailand.
- Small Ports with 2 platforms that length in size are 100 and 150 meters and 25 meters of width.
- Small Water Reservoirs will supply water treatment plant consisting of Pa Yain Byu Reservoir and Ta Laing Gya Weir (Approved IEE).
- Initial Phase Power Plant will generate electricity supply from gas-engine power plant, gas-turbine power plants and combined cycle power plants.
- Telecommunication Landline for Information Technology (IT) including fixed line and high-speed internet with fiber optic cable from the Myanmar-Thailand Border will be installed.
- LNG Terminal once when complete will provide sufficient clean and economical price of natural gas to the power plants in the industrial estates.
- Initial Township that will not only build for commercial and residential accommodation to support the Initial Industrial Estate, but to establish an actual Initial Township which has all needed functions and facilities in order to create good environment and livelihood.

Prior to conduct the Project EIA, a number of environmental studies have been conducted in the DSEZ, in accordance with the stage of the entire industrial estate – initial phase development. The literatures are reviewed and incorporated into this EIA study. They are following:

- The Initial Environmental Examination (IEE) for Dawei Sea Port and Industrial Estate Development (TEAM, 2012a);
- The Social Impact Assessment (SIA) for Dawei Sea Port and Industrial Estate Development (TEAM, 2012c);
- The Environmental Impact Assessment (ESIA) for Main Road (SEATEC, 2012c).
- Environmental Impact Assessment for Dawei Industrial Estate-Initial Phase Project (SEATEC in association with UAE, 2012)
- The Social Impact Assessment (SIA) for Medium and Light Industrials for Dawei Development (TEAM, 2013)
- The Environmental and Health Impact Assessment (EHIA) for the Dawei Sea Port (TEAM, 2013).

However, the Project information used in this EIA report bases on the current scenario and is considered the most valid at the time of the report preparation. Changes in the Project information may occur overtime and, therefore, readers and project developers are advised to check and confirm the update details at the time of review and implementation.

Source: DRC (2016)

Figure 2.2-1 Location of Initial Township in the Dawei Special Economic Zone

## 2.2.2 Status of Project Preparation

The existing infrastructure are unpaved road. The road is linked between Dawei SEZ and Thailand. The Project can be accessed by this road from Ban Phu Num Ron, Kanchanaburi by 4-WD type car. Land plot within the Project boundary has almost been clear of vegetation and some area are leveled grade. Water is supplied by the Pa Yain Byu Reservoir and Ta Laing Gya Weir. Power will be soon supplied by the power plants but at the present electricity still relies on diesel generator. The prototype of 8-floor service apartment was constructed in 2015.

DRC plans to build the Township in accordance with demand of residence in DSEZ. This will be achieved through construction of multi-stories of apartments, hospitality and commercial buildings, hospital and schools and others facilities. Development of basic infrastructures, Main Roads (MR), Secondary Roads (SR), Tertiary Roads (TR) and steel bridge, Flood Controlling System and the share facilities with the industrial estate such as Waste Management System and Fire station. This construction will be gradually developed in parallel with phases of the industrial estate.

Details on design concept and project description are presented *Chapter 4 Project Description and Alternatives*. Some detailed design has been submitted to Dawei Special Economic Zone Management Committee (DSEZMC) since 2<sup>nd</sup> November 2015 in compliance with the requirement under the Concession Agreement. The EIA study has been conducted in accordance with such submitted technical information. The EIA study has made use of the technical study. Especially the detailed design of the waste management system (See Annex 4-2).

## 2.2.3 Related Projects

The Dawei Special Economic Zone is located in northern part of Maungmagan Bay, Andaman coastline. Since the Italian-Thai Development signed the Concession Agreement (CA) with the DSEZMC, development of the entire DSEZ consists of the other 9 related projects following:

1. Two-Lane Linked Road;
2. Small Port;
3. Initial Industrial Estate;
4. Initial Phase Power Plant;
5. Initial Township;
6. Small Water Reservoir;
7. Telecommunications Landline;
8. LNG Terminal; and
9. Boil-off Gas and Temporary Power Plants.

## 2.3 PRESENTATION OF THE PROJECT PROPONENT

Dawei Residence Company Limited (DRC) is a Myanmar company established by Dawei Residence Holding Limited (DRHL) to develop, invest, own any permits and licenses, operate and provide the services in relation to residence business and relevant activities in the DSEZ. Herein this EIA report is referred as “*The Project Proponent*” (see Annex 2-1, brief information on the Project Proponent). DRC is awarded by the Dawei Special Economic Zone Management Committee (DSEZME) in developing “*The Initial Township*” (The Project). The Project Proponent is founded on April 9<sup>th</sup>, 2015 in the Republic of the Union of Myanmar and is subsidiary of the Italian Thai Development Public Company Limited (ITD). The Project Proponent has following registered address:

- Yangon Head Office is at 6<sup>th</sup> Floor, Salomon Business Center, 224/A, U Wisara Road, Bahan Township, Yangon, Myanmar. Telephone number is +951-535-421. Fax number is + 951-535-421. Company website is <http://www.daweiindustrialestate.com>. Google GPS coordinate is 16.804441, 96.142993.

## 2.4 PRESENTATION OF THE EIA STUDY TEAM

DRC as the Project Proponent delegates United Analyst and Engineering Consultant Co., Ltd. (UAE) to conduct the Environmental Impact Assessment (EIA) of the project. In this report, UAE is referred to “*the EIA Study Team*”.

UAE is formed by environmental professionals (in Annex 2-2). UAE provides complete loop of environmental services from project conception through project planning and feasibility study, environmental samplings, analytical laboratory, environmental assessments, auditing and monitoring and public participation. The service experiences various physical and utility infrastructures including urban mass transit system, ports, power plants, oil and gas and industrial estate. Consequently, UAE can provide comprehensive services covering all aspects of development projects and business management. UAE has completed assignments not only in Thailand but also in neighboring countries in AEC, particularly Lao PDR, Viet Nam, Cambodia and Myanmar. The EIA Consultant has following registered address:

- 81 Udomsuk 41, Bangchak, Phrakhanong, Bangkok, Thailand 10260  
Telephone number is +66-2763-2835. Fax number is +66-2763-2830. Company website is [www.uaec consultant.com](http://www.uaec consultant.com)

### 2.4.1 Implementation Organization for the EIA

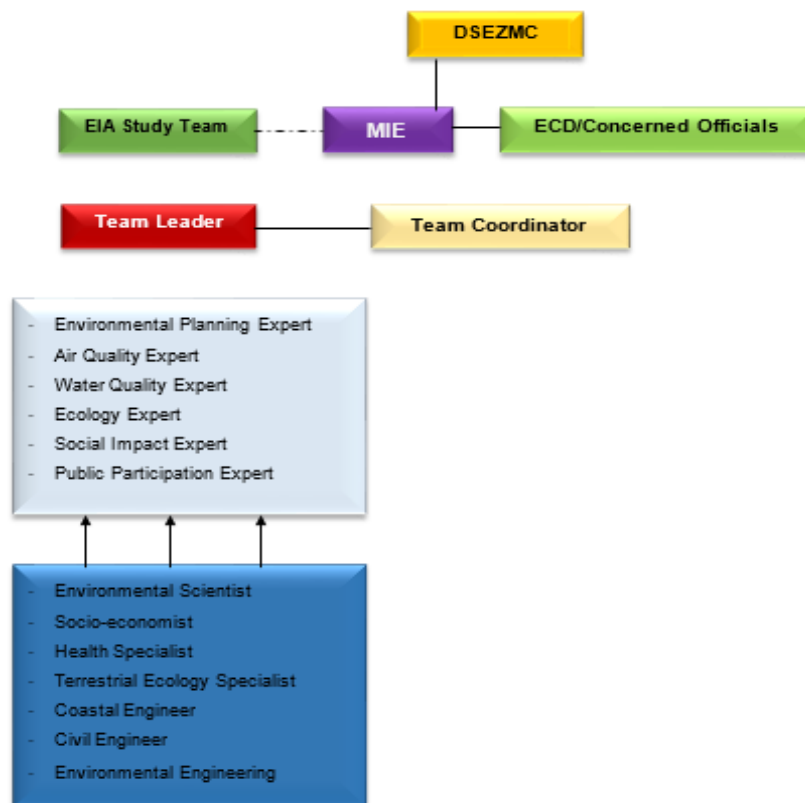

Organization in charge of the implementation of the EIA is presented in Table 2.4-1. The members of EIA Study Team are listed in Table 2.4-2 and Table 2.4-3.

**Table 2.4-1 Implementation Organization of EIA**

Consultant	Organization	Responsibility
International Lead Consultant	United Analyst and Engineering Consultant Ltd. (UAE)	Overall management and technical aspect of EIA
Local Consultant	Resource and Environmental Myanmar Ltd. (REM)	Public Consultation Meeting

Source: EIA Study Team

The EIA study is conducted by a multidisciplinary team consisting of professionals in various related disciplines. The EIA study team consists of a core study and planning group and a technical support group. A simple organizational structure for conducting and managing the EIA study is shown in Figure 2.4-1. The Team Leader manages technical aspect of the EIA study. The Team Coordinator assists the Team Leader in coordinating among members of the EIA team and among the EIA team, Project Proponent, and the Myanmar Environmental Conservation Department (ECD).

Source: EIA Study Team

**Figure 2.4-1 Organization of the EIA Study Teams**

The core study and planning group of the EIA study team consists of qualified and experienced professionals in various technical areas relevant to major environmental and social impacts of the Project, including (i) air pollution; (ii) water pollution; (iii) terrestrial ecology forest and wildlife; (iv) waste management; (v) public participation; (vi) social impact assessment; (vii) occupational health and safety; and (viii) environmental management planning. The environmental management planning expert will assist the Team Leader to ensure that

scoping and final EIA report will meet all requirements prescribed in the administrative instruction of EIA, EIA Procedure and the EIA Guidelines, and ECD comments and recommendation including a practical environmental management plans and mitigation measures are enable to implement. The core study and planning group will be supported by a technical support group consisting of professionals in various disciplines relevant to the environmental and social contexts, including; (a) environmental sciences; (b) socio-economics; (c) public health; (d) terrestrial ecology; and (e) civil engineering and environmental engineering.

The members of EIA Core Specialist Team are listed in Table 2.4-2 and Technical Expert Team are listed in Table 2.4-3. The profile of each organization and the curriculum vitae of the key experts of the EIA Study Team are attached in Annex 2-3.

**Table 2.4-2 Members of the EIA Specialist Team**

Name of Organization	Name	Position	Background	Years of Experiences
United Analyst and Engineering Consultant Ltd. (UAE)	Mrs. Suparatana Jotisakulratana	EIA & Public Consultation Specialist (EIA Registered)	M.Sc. (Environmental Biology) B.Sc. (Sanitation)	36 years
	Ms. Wilasinee Anomasiri	Socio-Economic and Indigenous Specialist	Ph.D. (Environmental Management) M.A. (Social Science) B.A. (Geography)	30 years
	Ms. Pensri Watchalayan	Occupational Health and Safety Specialist	Ph.D. (Environmental Management) M.Sc. (Toxicology) B.Sc. (Occupational Health & Safety)	27 years
	Ms. Nathinee Srinate	Environmental and Waste Management Specialist	Ph.D. (Chemical Engineering) M.Eng. (Chemical Engineering) B.Sc. (Chemical Technology)	11 years
	Ms. Rujiroj Anambutr	Land Use Specialist	Ph.D. (Urban & Environmental Planning) M.Sc. (Urban Planning) M.Sc. (Landscape Architecture) B. Arch.	27 years
	Ms. Ratata Timmanee	Air and Noise Specialist	M.Sc. (Industrial Public Health) B.Econ. (Economy)	23 years
	Mr. Watana Sukasem	Water Resources Specialist	M.Sc. (Oceanography) B.Sc. (Oceanography)	27 years
	Mr. Kanchit Womgsaengchan	Wastewater and Water quality Management Specialist	M.Sc. (Environmental Management & Technology) B.Sc. (Sanitary Science)	28 years
Resource and Environmental Myanmar Ltd. (REM)	Mrs. Khin Ohnmar Htwe	Social Specialist	M.A. (Geography) B.A. (Geography) Diploma in English	23 years

## 2.5 SCOPE OF THE EIA

Most of project activities during construction and operation phases will be restricted in the proposed area of 1.375 square kilometers of the Initial Township. Therefore, evaluation of impacts on environment will be emphasized in the Project and adjacent areas. Impacted area assessed in this EIA study are vary depending on the environmental and social aspects.

In principal the impact area is assessed within 5 kilometers in radius from the Project boundary. Primary data (2012-2015) are gathered from the project sites and secondary data are gathered from previous studies and the other related EIA and IEE projects in DSEZ. Size of data or area of samplings are confirmed to cover scope of the EIA study in all aspects.

4 types of resources are conducted environmental and social impact assessment; physical, ecological, economic development and social and cultural resources. Table 2.5-1 presents the resources that may be relevantly impacted or benefited from the Project activities. Twenty of concerned aspects are assessed both during construction phase and operation phases. Materials and methodology in this EIA assessment are presented in Table 2.5-2.

**Table 2.5-1 Scope of Environmental Impact Assessment for the Initial Township**

Physical Resources		Ecological Resources	
1. Climate and Air Quality		1. Surface water	
2. Noise and Vibration		2. Biology and Forest	
3. Topography and Soil		3. Wildlife	
4. Hydrology			
5. Surface water and Sediment			
6. Groundwater			
7. Geology and Seismology			
Economic Development		Social and Cultural Resources	
1. Initial Industrial Estate Development		1. Communities and population	
2. Infrastructure Facilities		2. Health Facilities	
3. Traffic and Transportation		3. Education Facilities	
4. Land Use		4. Facilities and Infrastructure	
		5. Land Use and Land Holding	
		6. Historical and Archeological Sites

## 2.6 MONREC'S COMMENTS ON SCOPING AND DRAFT EIA REPORT

As required in the EIA process, DRC submitted the scoping EIA Report to the Environmental Conservation Department (ECD) of the Ministry of Natural Resources and Environmental Conservation (MONREC). ECD commented on the scoping reports for 2 times, in February 2016 (the 1<sup>st</sup> comments) and the 10<sup>th</sup> March 2016 (the 2<sup>nd</sup> comments). The comments and recommendations were added and corrected, as presented in Table 2.6-1 and Table 2.6-2, respectively.

Later on, DRC submitted draft final EIA Report and ECD commented on 3<sup>rd</sup> February 2017 (the 3<sup>rd</sup> comments) and responses to the comments were summarized in Table 2.6-3. Then, DRC re-submitted the draft final EIA Report and replied by MONREC on 17<sup>th</sup> July 2017 (the 4<sup>th</sup> comments), points to be supplemented to remarks and opinions on the project to be implemented in the Township were following Table 2.6-5.

## **2.9 PROJECT DEVELOPER'S ENDORSEMENT OF THE EIA REPORT**

DRC on behalf of the Project consortium gives full endorsement of this EIA report and is fully committed to the implementation of all measures, including the provision of the necessary funds and human resources.

DRC will at all times comply fully with the commitments, mitigation measures, and plans that have been presented in this EIA Report.

DRC shall fully implement the EMP, all Project commitments, and conditions, and is liable to ensure that all contractors and subcontractors of the Project comply fully with all applicable Laws, including the Environmental Conservation Law (2012), Environmental Conservation Rules and Environmental Impact Assessment Procedure (2015), as well as the EMP, Project commitments and conditions.

List of commitments are prescribed in *Chapter 3, Section 3.5* and EMP and mitigation measures commitments are prescribed in *Chapter 8, Section 8.8*.

## CHAPTER 3

# OVERVIEW OF THE POLICY, LEGAL AND INSTITUTIONAL FRAMEWORK

### 3.1 MYANMAR REGULATORY FRAMEWORK

Environmental legislation is superior key in operation and management of the project. Therein, the principle for environmental management are formulated based on consideration of related national Policies, Laws and Regulations. Most of the legislation listed here are recent and still implement in the Union while some Acts are enacted since the union was under administration of the British India. The considerations in this chapter will be deliberately implemented and mandated through various stages of the Project development, from pre-construction, construction, operation and decommissioning.

The National Commissions for Environmental Affairs (NCEA) formed in February 1990 outlined the *Myanmar Agenda 21*, which contains social, economic, institutional and infrastructural including environmental conservation program. 56 environmental policies and regulations related with environmental conservation and protection and sustainable development were formulated under the National Environmental Conservation Committee (NECC), in April 2011.

As of May 2017, Myanmar has 21 ministries under the Office of the president. The leading ministry, as the focal and coordinating agency, for overall environmental management are the Environmental Conservation Department (ECD) of the Ministry of Natural Resources and Environmental Conservation (MONREC), is derived from the Ministry of Environmental Conservation and Forestry (MOECAF).

#### 3.1.1 Legislation Related to Environmental Social and Health Considerations

The implementing agencies are required to make efforts to mitigate impacts to physical and biological environment, social and cultural environment including to enhance human quality in sustainable environment in concurrent with the Project development. The fundamental laws and regulations related to the environmental social and health considerations in the Project are summarized in Table 3.1-1.

Source: EIA Study Team

Principle for the legislation listed above in relation to the project is fully prescribed in details in Annex 3-2. Overall, the legislation related to environmental social and health considerations are grouped and summarized in the following:

### 3.1.1.1 Environmental Foundation

The National Environmental Policy (1994), the Environmental Conservation Law (2012) and the Environmental Conservation Rules (2014) are foundation of environmental management and considerations. The National Environmental Policy aimed to establish a sound of environmental policies in the utilization of water, land, forests, mineral, marine, and other natural resources, in order to conserve the environment and prevent its degradation. The Policy calls for the integration of environmental development and to achieve sustainable development within the country, as well as giving environmental protection a priority in promoting economic development.

Followed by The Environmental Conservation Law (ECL) enacted in March 2012. This law is a fundamental law of environmental management and conservation in Myanmar. The law was prepared by MOECA (MONREC) and deliberately mandated to the Environmental Conservation Rules (ECRs), as details enforcement regulations. Besides, ECL stipulates MONREC's responsibility for environmental policy, administration, management plan and implementation of environmental monitoring, setting of environmental standards, management of hazardous waste, and EIA procedures.

### 3.1.1.2 EIA and Environmental Standard

Environmental Impact Assessment (EIA) is mandated by the Environmental Conservation Law 2012 in No.9/2012 Section 42 (b). It is legal requirement for all projects that may pose significant adverse impacts on the environment and social. The EIA Procedure formulated by MONREC in coordination with Asian Development Bank (ADB) was enact in December 2015.

This Procedure covers the following contents: screening of project, qualification for conducting the Initial Environmental Examination (IEE) or EIA Environmental Management Plan (EMP), preparation of report, Environmental Monitoring Plan (EMP), public involvement,

and approval procedure from ECD under MONREC, Environmental Compliance Certificate (ECC) including monitoring process after the IEE/EIA approval (See Annex 3-1).

MONREC formulated the National Environmental Quality (Emission) Guidelines (NEQG) in coordination with ADB in December 2015. The NEQG determines the guideline values for general emission such as air emissions, wastewater, noise levels, odor specific to sector of the Project activities i.e. food production, chemicals, infrastructure, manufacturing and power. The NEQG is prescribed in *Section 3.4.1* of this Chapter.

### **3.1.1.3 Natural Resources and Utilization**

#### **(a) Land Use**

The Land Acquisition Act (1894) serves as the principle law for land acquisition in Myanmar in order to formulate procedure for land acquisition and compensation. The act further outlines relevant procedures, including notice periods, procedures for objections to acquisition (Article 5), method of valuation of land, process for taking possession of land (Article 16 and 17), court processes and appeals (Article 18 and 24), procedures for the temporary occupation of land (Article 35), and the acquisition of land for companies (Articles 38). The act requires that compensation “*at market value*” is provided to those from whom the land is acquired (Article 23).

The Farmland Law and Rules (2012) determines the land use rights of farmland and the granting of land use rights to eligible farmers. It allows the right to sell, mortgage, lease exchange, and give either whole or part of the right to use the farmland. The law determines the formation as well as the roles/responsibilities of farmland administrative bodies at various levels. The Farmland Law and Rules determine procedures such as the application for farmland registration and obtaining land use certificates, application of transfer of farmlands for other purposes, and indemnities and compensation.

#### **(b) Water Environment**

The Conservation of Water Resources and River Law (2006). The aims of this law are to conserve and protect the water resources and river system for the beneficial utilization of public, enabling smooth and safe waterways navigation along rivers and creeks, contributing the development of the state economy through improving water resources and protecting river system from environmental impact.

#### **(c) Forestry / Biodiversity**

Objectives of the Protection of Wildlife and Wild Plants and Conservation of Natural Areas Law (1994) are to implement the government policy for wildlife protection and natural areas conservation and to carry out in accordance with the relevant International Conventions and to protect endangered species of wildlife and their natural habitats, to contribute for the

development of research on natural science, and to protect wildlife by the establishment of zoological/botanical gardens. It prescribes the formation of the committee for protection of wildlife and natural areas with its function and duties and the determination of natural areas and endangered species of wild animal which are to be protected.

The Forest Law (1992) supports conservation, sustainable forestry and socio-economic benefits while also partially decentralizing and encouraging the private sector and community participation in forest management.

#### **3.1.1.4 Social and Cultural**

The Protection and Preservation of Cultural Heritage Region Law (1994) prescribes the determination of cultural heritage regions for protection and preservation so as not to deteriorate due to natural disaster or man-made destruction. The Protection and Preservation of Ancient Monuments Law (2015) and the Protection and Preservation of Antique Objects Law (2015) are enacted to protect the antique objects, monuments and their information. The Protection of Rights of National Races Law (2015) promulgates to protect human right and equity of national race in such obtaining information and treatment.

#### **3.1.1.5 Public Health and Safety**

The Public Health Law (1972) is concerned with protection of people health by controlling the quality and cleanliness of food, drugs environment sanitation, epidemic diseases and regulation of private clinics. The Prevention and Control of Communicable Diseases Law (1995, revised in 2011) describes functions and responsibilities of health personnel and citizens in relation to prevention and control of communicable disease. It also describes measures to be taken in relation to environmental sanitation, reporting and control out breaks of epidemics and penalties for those failing to comply. The law also authorized the Ministry of Health to issue rules and procedures when necessary with approval of government.

The Control of Smoking and Consumption of Tobacco Product Law (2006) enacted to convince the public that smoking and consumption of tobacco product can adversely affect health in order to make them refrain from the use and to protect the public by creating tobacco smoke free environment including to protect public, children and youth from smoking and consuming tobacco product.

The Motor Vehicle Law (2015) and the Motor Vehicle Rules (1987). The Project Proponent has to promise to abide by the nearly all provisions of said law and rules, especially the provisions related to air pollution, noise pollution and life safety.

#### **3.1.1.6 Employment and Working Environment**

The Worker's Compensation Act (1923) stipulates that employer is required to make payments to employees who become injured or who die in any accidents arising during and

in consequence of their employment. Such compensation also must be made for disease which arise as a direct consequence of employment, such as carpal tunnel syndrome.

The Payment of Wage Act (1936) defines the payment obligation to the workers employed in the factories or railway administration. It stipulates the method of payment stating that the payment should be made in cash on a regular payday, and allows legal action against delayed payment or un-agreeable deduction.

The Factory Act stipulates the work condition of the workers in the factory such as working hours, worksite safety and health measures. According to the act, worker at age 18 or over shall not work exceed 8 working hours per day or 44 hours per week, and the working days shall not exceed 6 days per week. As for worksite safety, the factory shall be kept clean with proper ventilation, light and heat and the workspace shall be situated away from drains, latrines or other things which create a bad or unhealthy smell.

The Leave and Holidays Act (1951, partially revised in 2014) has been used as the basic framework for leaves and holidays for workers with minor amendment in 2006 and 2014. This defines the public holidays that every employees shall be granted with full payment. It also defines the rules of leaves for workers including medical leave, earned leave and maternity leave.

The Labor Organization Law (2011) replaced the Trade Union Act enacted in 1927 for protecting the right of the workers, having good relations among the workers or between the employer and the worker, and for forming and carrying out the labour organization systematically and independently. Under the law, the labour organization has the right to carry out freely in drawing up their constitution and rules. It has the right to negotiate and settle with the employer if the workers are unable to obtain the right of the workers contained in the labour laws. On the other hand, the employer shall recognize the labour organizations and assist as much as possible if the labour organizations request for help for the interest of his workers.

The Social Security Law (2012) enacted in 2012, was amended the Social Security Act in 1954. It stipulates the formation and implementation of social security system. The Labour Dispute Settlement Law (2012) was enacted for safeguarding the right of workers or having good relationship between employer and workers and making peaceful workplace or obtaining the rights fairly, rightfully and quickly by settling the dispute of employer and work justly. It stipulates that employer in which more than 30 workers are employed shall form the workplace coordinating committee consisting of the representatives of workers and the representative of employer.

The Minimum Wage Law (2013) passed in March 2013, was replaced the 1949 Minimum Wage Act. The law provides a framework for minimum wage determination: the presidential office establishing a tripartite minimum wage committee shall decide minimum

wage with industrial variation based on a survey on living costs of workers possibly every two years. This also stipulates equal payment.

### **3.1.1.7 Industrial Laws**

The Foreign Investment Law (2012) is set up to delineate the statutory characteristics of investment into Myanmar. There are specific requirements in the law that stipulate the protection of the environment.

The Export and Import Law (2012) was enacted and the Control of Imports and Exports Act (1947) was abolished. It aims to implement the economic principles of the State successfully, to lay down the policies to export and import that support the development of the State, and that are to be in conformity with the international trade standards.

The Electricity Law (2014) was replaced by the new Electricity Law, a comprehensive piece of legislation covering licensing, a new regulatory commission, standards, inspection, tariff, and restrictions. The electricity law divides projects into “small” (up to 10 MW), “medium” (between 10 MW to 30 MW) and large (up to 30 MW); the states and regions can issue permits for small and medium power plants. In case these plants are not connected to the nation grid, the Union Government Ministry is not the primary authority involved. The authorities have a legal right to use land for purpose of power plants under the Electricity Law, and have the right to expand and maintain their facilities. The law also provides that the authorities can build transmission lines in accordance with existing laws.

### **3.1.1.8 Special Economic Zone Laws**

The Myanmar Special Economic Zone Law (2014), which was enacted in 2013 and revised in January 2014, provides the basis for the governments’ establishment to SEZs to encourage economic growth and foreign investment through several incentives such as a five-year tax exemption and 50% income tax relief on items exported overseas for five years. Article 35 of this law stipulates that investors shall abide by the environmental standards described in the Myanmar Environmental Conservation Law and International Standards.

## **3.1.2 The Application of Laws and Legal Commitments**

The necessity for the Project Proponent in application of permissions prior executing the development is to ensure that the Project will be effectively managed, with facilities and mitigation measures and be sufficient and sustain the union environment. Application of the following policy, laws, rules procedure and guideline that relates to the DSEZ Initial Industrial Estate are suggested in Table 3.1-2.

**Table 3.1-2 Application of relevant environmental social and health laws and to be implemented legal commitments**

No.	Legislation	Proposes	To be implemented commitments
1.	The Environmental Conservation Law (2012)	To construct a healthy and clean environment and to conserve natural and cultural heritage for the benefit of present and future generations and to maintain the sustainable development through effective management of natural resources and to enable to promote international, regional and bilateral cooperation in the matters of environmental conservation.	<ul style="list-style-type: none"> <li>• The Project Proponent has to pay the compensation for damages if the project will causes injuries to environment under the sub-section (o) of section 7 of said law.</li> <li>• The Project Proponent has to purify, emit, dispose and keep the polluted materials in line with the stipulated standards, under section 14 of said law</li> <li>• The Project Proponent has to install or use the apparatus which can control or help to reduce, manage, control or monitor the impacts on the environment, under section 15 of said law.</li> <li>• The Project Proponent has to allow relevant governmental organization or department to inspect whether performing is conformity with the terms and condition included in prior permission, stipulated by the ministry, or not, under section 24 of said law.</li> <li>• The Project Proponent has to comply with the terms and conditions included in prior permission, under section 25 of said law.</li> <li>• The Project Proponent has to abide by the stipulations included in the rules, regulation, by-law, order, notification and procedure issued by said law, under section 29.</li> </ul>
2.	The Environmental Conservation Rules (2014)		<ul style="list-style-type: none"> <li>• The Project Proponent has to avoid emit, discharge or dispose the materials which can pollute to environment, or hazardous waste or hazardous material prescribed by notification in the place where directly or indirectly injure to public under sub-rule (a) of rule 68.</li> <li>• The Project Proponent has to avoid performing to damage to ecosystem and the environment generated by said ecosystem under sub-rule (b) of rule 68.</li> </ul>

### 3.1.3 International Agreements and Treaties

Myanmar has signed and been a member of several international conventions, treaties and agreements related to environment is shown in Table 3.1-3.

**Table 3.1-3 Ratified recent international agreements related to environmental and social considerations.**

No.	International Agreements and Treaties	Date Ratified
1	Basel Convention, 1989	2015
2	Ramsar Convention, 1971	2005
3	Stockholm Convention on Persistent Organic Pollutants, 2001	2004
4	Convention on International Trade in Endangered Species of Wild Fauna and Flora, 1979	1997
5	United Nations Framework Convention on Climate Change, 1992	1994
6	Convention on Biological Diversity, 1992	1994
7	Montreal Protocol on Substances that Deplete the Ozone Layer, 1989	1993
8	London Amendment to the Montreal Protocol on Substances that Deplete the Ozone Layer, 1990	1993

## 3.2 MYANMAR INSTITUTIONAL FRAMEWORK

Dawei Resident Company Limited (DRC) is an organization that govern Initial Township in the DSEZ as shown in Figure 3.2-1. It consists of five divisions that are managed under the MIE president. Generally, the president is supervising the investment and one of his prominent roles and duties is implementation the legislations, by supervising, inspecting and managing the other matters in land use, environmental conservation, health, education, finance and taxation, development, transport, communication, security, electricity, energy and water supply including coordinating with the relevant government departments and organizations.

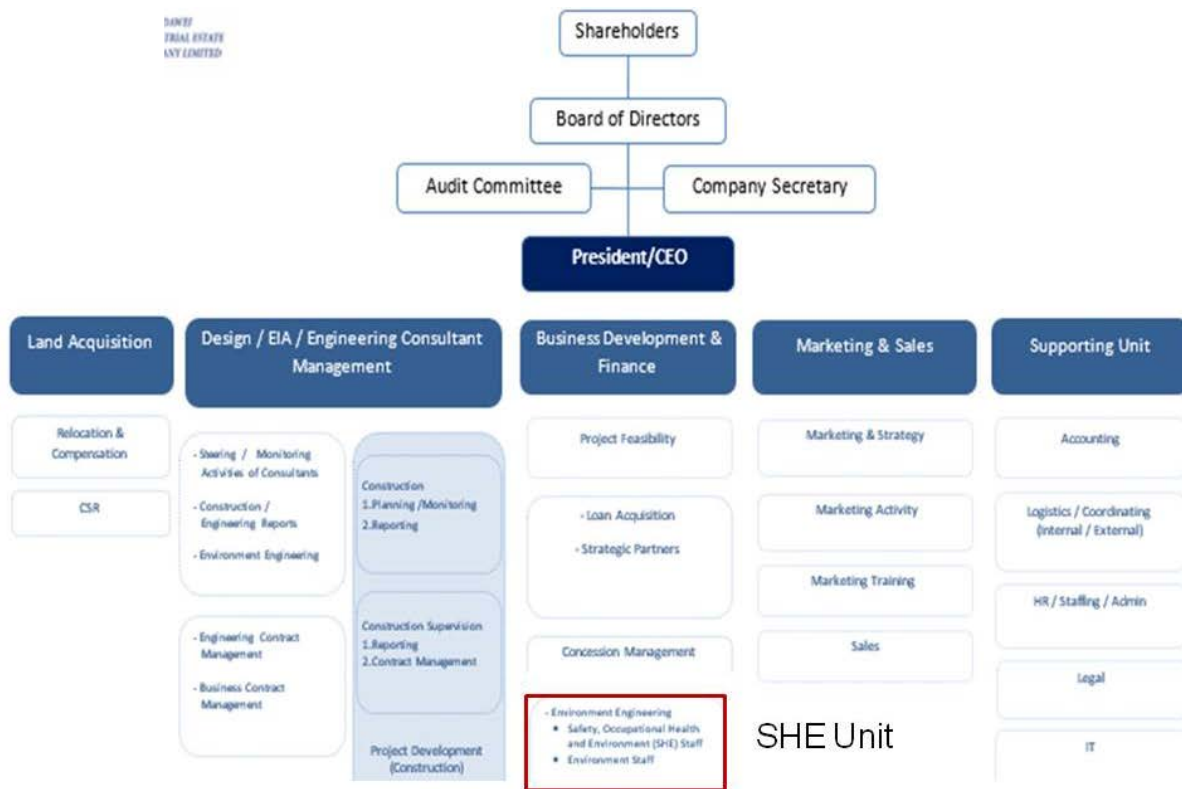

It should be noted that the planning and development of the Project is dynamic. During the time of this EIA report preparation, the governments of Thailand and Myanmar are evaluating an establishment of Special Purpose Vehicles (SPV) as a major driver for the project development. Should the SPV is established, significant changes to the organization and responsibilities of the parties involved in the Project may be changed.

### 3.2.1 Arrangement at the National and Sector Level

At the national level, the Environmental Conservation Committee (ENCC) serves as mechanism for inter-ministerial coordination. Authorities and functions of ENGG are prescribed in Articles 7 to 13 of the Environmental Conservation Rules.

One of ENCC's main functions related to this Project is to oversee the management of the EIA process by MONREC through ECD. ECD will serve as coordinator among various concerned sector departments to ensure that the EIA and implementation of EMP will address environmental and social issues of concerns of relevant sector departments.

Source: DRC (2015)

**Figure 3.2-1 Organization Structure of MIE**

The EIA process for this Project will be administered by the central ECD in coordination with the regional ECD and various government to organizations at the regional, township, and district levels.

### 3.2.2 Arrangements at the Project Area

In Dawei Special Economic Zone Management Committee (DSEZMC), the Project will be implemented as a Public-Private Participation (PPP) project under a concessional arrangement between the Project Proponent and the DSEZ Management Committee. The organizational structure for the development of DSEZ is prescribed by the DSEZ Law (2011). The development of the DSEZ is carried out under the framework set by the DSEZ Law. Under this law, two bodies were established the DSEZ Management Committee and the DSEZ Working body to take charge of DSEZ management and general administration affairs.

The DSEZMC is essentially responsible for facilitating resolving issues between the Government, the Central Body and developers/investors. The Committee's wide-ranging and

important responsibilities include, but are not limited to: supervising and inspecting matters regarding implementation of investment and establishment plans, land-use, environmental conservation, waste control, health, education, finance and taxation, development, communication, security, infrastructure and coordinating with the relevant governmental departments. Other relevant agencies are 14 representatives of government agencies and organizations from respective ministries involved in development activities of the Supporting Working Body (SWB) in the project area. Their key responsibilities are summarized in Table 3.2-1.

**Table 3.2-1 Roles and responsibilities of relevant departments functioning in DSEZ**

No.	Department	Roles and Responsibilities
1.	Department of General Administration	Management and monitoring to cooperate and negotiate with local peoples.
2.	Department of Human Settlement and Housing	The Department of Human Settlement & Housing Development is upgrading the living standard of the people by promoting the urban and regional development, by establishing industrial zones at the new satellite towns.
3.	Department of Immigration and National Registration	Responsible for checking and permission for immigrant staffs, workers and visitors to the project area.
4.	Myanmar Police Force	Establish civil jurisdictions in the project area.
5.	Department of Labor	Workers' legal rights and privileges and encourage fair labour practices with a view to establishing cordial relations between employers and workers according to the existing Laws in Myanmar.  Registering foreign workers in Myanmar according to directive of the Myanmar Foreign Investment Commission.
6.	Directorate of Trade	Responsible for the formulation of trade policies and plans with the aim to regulate the smooth flow of internal and external trade.
7.	Department of Development Affairs	Responsible for the urban development.
8.	Department of Road Transportation	Passenger transportation service for inter-city transportation and intra-city transportation, to carry out the transportation services of local goods and export items. The Directorate of Road Transport carries out registration of motor vehicles and driving licenses.
9.	Department of Investment and Company Administration	Responsible for register the incorporation and administration of companies, in accordance with the provisions of the Myanmar Companies Act, 1914.
10.	Department of Custom	Responsible for levy duty on imported goods in accordance with the existing laws, rules and regulations, to oversee the imports and exports whether they are complied with the existing laws and regulations or not and to investigate and prevent illegal imports and exports.
11.	Department of Law, Court and Justice	For giving legal advice on matters relating to international conventions and regional agreements, and also on matters of bilateral or multilateral treaties, memorandums of understanding, memorandums of agreement, local and foreign investments and other instruments that are to be ratified by the Union of Myanmar.
12.	Department of Municipality	Dealing with locally affairs, to the close contact with the daily life of the citizens.
13.	Representative from Tanintharyi Division	To communicate with Local Government.

### 3.3 INTERNATIONAL POLICIES, GUIDELINES AND STANDARDS

The relevant international policies, guidelines and standards for environmental and social impacts of project referred by most countries are those issued by the World Health Organization (WHO), the U.S. Environmental Protection Agency (EPA), the World Bank, and the International Finance Corporation (IFC). The policies, guidelines and standards of the World Bank and IFC are cross referenced and complementary as the IFC, is an organization of the World Bank Group. There are also adopted by most development organizations such as the Asian Development Bank. It should be noted that the guidelines and standards recommended by the World Bank and IFC, especially those related to environmental pollution, also gave due consideration to the guidelines and standards of the EPA and WHO.

Only those international policies, guidelines and standards relevant to this Project are discussed here in 3.4.1 IFC's Standard and Guidelines IFC's standards. The guidelines relevant to this Project are described in two documents: The Performance Standards on Environmental and Social Sustainability 1<sup>st</sup> January, 2012 and Environmental, Health, and Safety-General Guidelines 30<sup>th</sup> April, 2007, respectively. The former document describes eight performance standards on environmental and social sustainability which IFC requires its clients to apply throughout the project life cycle. The later document provides general guidelines for environmental, health and safety (EHS) for development projects. Essential requirements in the three IFC documents pertaining to this Project are summarized below:

#### 3.3.1 Performance Standards on Environmental and Social Sustainability, 1<sup>st</sup> January, 2012

IFC prescribes eight Performance Standards to which the Project Proponent will need to comply throughout the investment life. The eight performance standards (PS) are:

- **PS1-Assessment and Management of Environmental and Social Risks and Impacts** requires the Project Proponent, in coordination with other responsible government agencies and third parties as appropriate; to conduct a process of environmental and social management system (ESMS) "*appropriate to the nature and scale of the project and commensurate with the level of its environmental and social risks and impacts*". The ESMS will incorporate the following elements: (i) policy; (ii) identification of risks and impacts; (iii) management programs; (iv) organizational capacity and competency; (v) emergency preparedness and response; (vi) stakeholder engagement; and (vii) monitoring and review. These requirements are explained in details in the PS document and associated guidelines.
- **PS2-Labor and Working Conditions** requires the Project Proponent to :  
(i) formulate and implement human resources policies and procedures appropriate to its size and workforce that set out its approach to manage workers consistent with the requirements of this Performance Standard and National Law; (ii) provide

reasonable working conditions and terms of employment; (iii) treat migrant workers on substantially equivalent terms and conditions to non-migrant workers carrying out similar work; (iv) establish grievance mechanism; (v) refrain from using child labor and forced labor; and (vi) provide a safe and healthy work environment, taking into account inherent risks in its particular sector and specific classes of hazards in the clients work areas, including physical, chemical, biological, and radiological hazards, and specific threats to women. These requirements will also be applied to workers of the contactors through effective contractual agreements between the client and the contactors.

- **PS3-Resource Efficiency and Pollution Prevention** requires the Project Proponent to: (i) efficiently uses energy and water; and (ii) uses Best Available Techniques (BAT) in pollution control.
- **PS4-Community Health, Safety, and Security** requires the Project Proponent to: (i) evaluate the risks and impacts to the health and safety of the affected communities during the project lifecycle; and (ii) establishes preventive and control measures in consistent with good international industry practice (GIIP), such as in the World Bank Group Environmental, Environmental, health and Safety Guidelines (EHS Guidelines) or other internationally recognized sources. The requirements are elaborated in the PS document. Some of the requirements, such as hazardous materials management, are similar to those in PS3. In essence, safety aspects to construction and operations of all Project facilities, including support facilities or infrastructure. Health risks will also be included.
- **PS5-Land Acquisition and Involuntary Resettlement** requires the Project Proponent to avoid land expropriation, physical displacement, and adverse impacts on livelihoods and ways of life of people in the project area. The process of land acquisition has to ensure community engagement, fair compensation for loss of land, properties, and livelihood; grievance mechanism, and appropriate resettlement and livelihood restoration planning and implementation.
- **PS6-Biodiversity Conservation and Sustainable Management of Living Natural Resource** requires the EIA to consider direct and indirect project related impacts on biodiversity and ecosystem services and identify any significant residual impacts. As matter of priority, the Project Proponent should seek to avoid impacts on biodiversity and ecosystem services. When avoidance of impacts is not possible, measures to minimize impacts and restore biodiversity and ecosystem services should be implemented. Given the complexity in predicting project impact on biodiversity and ecosystem services over the long term the Project Proponent should adopt practice of adaptive management in which the implementation of mitigations measures are responsive to changing conditions and the results of monitoring throughout the projects life cycle.

- **PS7-Indigenous Peoples** requires the EIA to identify all communities of indigenous people within the project area of influence who may be affected by the project, as well as the nature and degree of the expected direct and indirect economic, social, cultural (including cultural heritage), and environmental impact on them. Adverse impacts on affected communities of Indigenous Peoples should be avoided where possible. Where alternatives have been explored and adverse impacts are unavoidable, the Project Proponent will minimize, restore, and/or compensate for these impacts in a culturally appropriate manner commensurate with the nature and scale of such impacts and the vulnerability of the affected communities of indigenous people.
- **PS8-Cultural Heritage** requires the Project Proponent to: (i) protect cultural heritage from the adverse impacts of project activities and support its preservation; and (ii) promote the equitable sharing of benefits from the use of cultural heritage. The EIA will need to identify sites of heritage and assess their value or importance at the community, provincial and national levels. It should be noted that all the eight PS are in line with the Government's policy and regulations.

**3.3.2 Environmental, Health, and Safety-General Guidelines, 30<sup>th</sup> April, 2006. This publication provides general EHS guidelines covering the following subjects:**

- **Environment** covering: (i) air emissions and ambient air quality; (ii) energy conservation; (iii) wastewater and ambient water quality; (iv) water conservation; (v) hazardous materials management; (vi) waste management; (vii) noise; and (viii) contaminated land.
- **Occupational Health and Safety** covering: (i) general facility design and operation; (ii) communication and training; (iii) physical hazard; (iv) chemical hazards; (v) biological hazards; (vi) radiological hazards; (vii) personal protective equipment; (viii) special hazard environments; and (ix) monitoring.
- **Community Health and Safety** covering: (i) water quality and availability; (ii) structural safety of project infrastructure; (iii) life and fire safety (L&FS); (iv) traffic safety; (v) transport of hazardous materials; (vi) disease prevention; and (vii) emergency preparedness and response. Construction and Decommissioning covering: (i) environment; (ii) occupational health and safety; and (iii) community health and safety.
- **Construction and Decommissioning** covering: (i) environment; (ii) occupational health and safety; and (iii) community health and safety.

### **3.3.3 World Bank's Pollution Prevention and Abatement Handbook 1998 Toward Cleaner Product**

The World Bank's Pollution Prevention and Abatement Handbook (PPAH) is a comprehensive document providing guidelines for industrial pollution control and recommends emission and ambient standard to be applied in environmental management. The recommended standards have taken into account the standards enforced by the EPA and recommended by WHO. They are referred to in the IFC's EHS Guidelines.

### **3.4 GUIDELINES AND STANDARDS APPLICABLE TO THIS PROJECT**

The country has recently established the environmental quality standards. The latest version announced on December 2015, “*The National Environmental Quality (Emission) Guidelines 2015*” is mainly used in this report and in assessing environmental impacts of the project. In case, where the national quality standard of some subjects such as groundwater and sediments are absent, the international standard is applied.

#### **3.4.1 National Environmental Quality (Emission) Guidelines**

The National Environmental Quality (Emission) Guidelines 2015 had specification for purposes and activities. In the Project, values for air emission and effluent levels depend on type of facilities. Herein, the project has 2 different types of facilities, residential and commercial and health care. The levels of emissions regarding to these facilities will concordance the guidelines. However, the guidelines for “*general purpose*” is applied in overall area of the project, “*besides the facility areas*” such as on drainage canals or water ways or in non-contaminated run-off areas, the guidelines for general purpose is presented in Table 3.4-1. These levels of parameters are subjected to both construction and operation phases.

**Table 3.4-1 General Purpose Guidelines of the National Environmental Quality (Emission) Standards 2015 during construction and operation phases.**

	45	dB(A) Nighttime <sup>a</sup>	

Source: MONREC (2016)

Emissions are needed to follow the guidelines in Section 2.6.8 for Road that has all parameters for effluent levels in accordance with the guideline for general purpose Table 3.4-2.

In operation phase, the project will relate to management of accommodation, hospitality and health care facilities. Therefore, The National Environmental Quality (Emission) Guidelines that are specific to the project falls into 2 Sections; Section 2.6.3 for “*Health Care Facilities*” and 2.6.4 “*Tourism and Hospitality Development*”. Overall, the effluent levels including wastewater, storm water runoff, effluent and sanitary discharge from these two facilities are the same as in the guideline for the “general purpose” in Table 3.4-2 except the following parameters:

**Table 3.4-2 Additional parameters for effluent levels for Health Care Facilities and Residential and Commercial**

Parameters	Guideline Values	
	Value	Unit
<b>Wastewater, Storm Water Runoff, Effluent and Sanitary Discharge (Operation Phase)</b>		
Cadmium		
- Residential and Commercial	0.10	mg/L
- Health Care Facilities	0.05	mg/L
Polychlorinated Dibenzodioxin and Dibenzofuran		
- Health Care Facilities	0.1	mg/L
Total Nitrogen		
- Residential and Commercial	0.10	mg/L

Level of air emission is excluded for management of the hospital waste in incineration. The hospital waste shall be managed, delivered and disposed in incineration at the waste management facility in the initial industrial estate. On the contrary, if the hospital or health care centre requested itself to have the incineration, level of air emission is prescribed below in Table 3.4-3.

**Table 3.4-3 Air Emission Levels (for hospital waste incineration facilities)**

Parameters	Unit	Value
Antimony, Arsenic, Lead, Chromium, Cobalt, Copper, Manganese, Nickel, Vanadium	mg/Nm <sup>3a</sup>	0.5

### 3.5 KEY COMMITMENTS

#### 3.5.1 List of Commitments

A consolidated summary list of environmental and social impacts and mitigation measures commitments that the Dawei Residence Company will be expected to stipulate in order to manage and mitigate potential impacts associated with the project development is provided below in Table 3.5-1 and summary of the legal commitments is presented in Table 3.5-2.

**Table 3.5-1 Dawei Residence Company's Commitments**

No.	Management	Commitments
1.	Overall Project Management	The Project commits itself to conserve and protect natural environment, development of human resource and preservation of public property, as stated in <i>The Constitution of the Union of Myanmar No.1/2008 Section 45 and Section 390</i> .
		The Project commits itself to get permission for investment, as the Project is capital intensive and strategic to the region according to <i>The Investment Law 2016, Section 35</i> .
2.	EIA Study	EIA study is conducted, as mandated by <i>the Environmental Conservation Law (2012), in No.9/2012 Section 42 (b) and the Investment Law Section 72</i> .  The Project commits itself that the ESIA study is undergone in concordant with <i>the Guidelines (2014) and Procedure (2015) for Environmental Impact Assessment</i> .
3.	Emission Compliance	The Project commits itself to prevent pollution, through the implementation of processes, practices and techniques that will minimize, avoid or reduce the pollution and comply with the enacted Myanmar Environmental Quality Standards or the International Standards, as prescribed in <i>The Special Economic Zone Law, Section 35</i> .
4.	Land Acquisition	The Project commits itself in receivable authorization and has right to obtain a long-term lease of land in according with the relevant laws and may lease land up to an initial period of 50 years after approval of the permit, as enacted in <i>The Investment Law 2016, Section 51 (a) and (b)</i> .
5.	Relocation of assets and Resettlement	The Project commits itself to bear the expenses of relocating and paying compensation in accordance with the agreements of the assets those are required to relocate and shall relocate the persons so as not to lower their original standard of living, to fulfill the fundamental needs as promulgated in <i>The Special Economic Zone Law 2011, Section 80</i> .
6.	Land clearing and Pre-Construction	The Project commits itself to get permission from the relevant agency before establishing any desirous activities to in reserve forest or all type of forests that in affiliate of <i>The Forest Law 1992, Section 12 and Section 23</i>
		The Project commits itself to get permission from the relevant agency before establishing any desirous activities to wild life/endanger species or threatening their natural habit and ecosystem as promulgated in <i>The Protection of Wildlife and Conservation of Natural Area 1994</i> .

**Table 3.5-1 Dawei Residence Company's Commitments**

No.	Management	Commitments
		The Project commits itself to get permission from the relevant agency before relocating, modifying or excavating or extending any parts of ancient monuments in according with <i>The Protection and Preservation of Ancient Monuments Law 2015, Section 15</i>
		The Project commits itself to obtain approval of Fire precaution and prevention (and/or Emergency Plan) prior construction of the township buildings as enacted in <i>The Fire Brigade Law 2015 Section 17</i> .
7.	Overall Construction	The Project commits itself to inform the relevant agency that if any antique objects or ancient monuments as defined in <i>the Protection and Preservation of Ancient Monuments Law 2015 and The Protection and Preservation of Antique Objects 2015</i> are found within the Project area.
		The Project commits itself to report immediately to the relevant agency, if natural mineral resources or antiques or treasure or mine are found above or under the land which the Project is entitled to lease or use, according to <i>The Special Economic Zone Law Section 80 (e)</i> and may continue the work on such land if the relevant agency allow. If not, the Project shall move the substituted arranged area.
		The Project commits itself to not make any significant alteration of topography or elevation of the land prior receiving the approval, according to <i>The Investment Law 2016, Section 66 and The Special Economic Zone Law Section 80 (d)</i> .
8.	Polder dike and Retention Ponds construction	The Project commits itself to not carry out any acts or channel shifting or disturbance as prescribed in <i>Section 12</i> and construction of such the structures as defined in <i>Section 15</i> , in the river-creek boundary, bank boundary and waterfront boundary without permission of the relevant agency, as prescribed in <i>The Conservation of Rivers, Creeks and Water Resources Law 2006, Section 8, Section 12 and Section 15</i> .
9.	Operation of the Township	The Project commits itself to not dispose of engine oil, chemicals, materials or substances which may cause water way/course and environmental damages into the river-creek, as prescribed in <i>The Conservation of Rivers, Creeks and Water Resources Law 2006, Section 11 (a) and Section 19</i> .
		The Project commits itself to not dispose living aquatic creatures or any materials in marine water courses as prescribed in <i>Section 39 of the Myanmar Marine Fishery Law 1990</i> .
		The Project commits itself to not cause pollution or harassment of aquatic organisms in a freshwater courses as prescribed in <i>Section 40</i> or alter water quality and volume as prescribed in <i>Section 41 in the Freshwater Fishery Law 1991</i> .
		The Project commits itself to operate and provide services in accordance with <i>The Labor Organization Law 2011, Section 41 (a) and (d), Section 43, Section 44 (a) to (d) and Section 51</i> . Also, The Project commits itself to aware of the formation of labor organization and its activities.
		The Project commits itself to settle any disputes between the project and labor organization or employee or workers in accordance with <i>the Settlement of</i>

**Table 3.5-1 Dawei Residence Company's Commitments**

No.	Management	Commitments
		<i>Labor Dispute Law 2012 and The Special Economic Zone Law 2011, Section 76 (a) and (b).</i>
10.	Employment	<p>The Project commits itself to employ citizen skilled workers, technicians and staff at least 25 percent in the first two years from the commencing year of operation and at least 50 percent in the second two years and at least 75 percent in the third two years, as prescribed in <i>The Special Economic Zone Law, Section 75</i></p> <p>The Project commits itself to employ, pay wages, and grant leaves and holidays in fairness and equity manners to the workers and/or employee in accordance with the stipulated laws: <i>The Minimum Wages Laws 2013, The Payment of Wages Act 2016, The Employment and Skill Development Law 2013, The Law Amending the Leave and Holidays Act 2006</i>.</p> <p>The Project commits itself to comply requirements and establish benefits for the employee and/or workers by the Project in accordance with <i>The Social Security Law 2012</i>.</p>
11	Training Program	The Project commit itself to establish training program and the center for training for industries and may include the Project Affected Persons (PAPs) from the relocation and resettlement program in accordance with <i>the Employment and Skill Development Law 2013 Section 16 to Section 23</i>
12	Occupational Health and Safety	The Project commits itself to comply the IFC EHS General guideline 2007 for workers
13	Commercial Area	The Project commits itself to establish and manage the commercial area which include retail shops, drug store and food services in accordance with <i>the Nation Drug Law 1992 and the Nation Food Law 1997</i>
14	Foundation of Hospital or Health Center	The Project commits itself to establish hospital or health center when appropriate number of residents in the Township have reached requirement that promulgated in the relevant law.
15	Prevention and Control of Communicable Diseases	The Project commits itself to follow the guidance and co-operate with health officers in prevention of the outbreak and effective control of the communicable disease as prescribed in <i>Section 8 of The Prevention and Control of Communicable Diseases Law 1995</i> The Project will report immediately to the nearest health department or hospitals if the defined epidemics in <i>Section 9</i> occur.
16	Smoke/Non-Smoking Areas	The Project commits itself to arrange the smoking and non-smoking area as prescribed in <i>Section 6 and Section 7 of The Control of Smoking and Consumption of Tobacco Product Law 2006</i> including carry measures and accepting the inspection in <i>Section 9 (c) and (d)</i> .
17	Uses of Vehicles	The Project commits itself to comply <i>The Motor Vehicle Law 2015</i> in obtaining ownership of all purposes and liabilities. The Project shall educate and campaign the vehicles' drivers in such manners as prescribed by the Law.
18	Conservation of Water Resources	The Project commits itself to manage water resources wisely and control the impacts to water courses as following:

**Table 3.5-1 Dawei Residence Company's Commitments**

No.	Management	Commitments
		Reuse and Recycling of water, Water conservation program, minimization of contaminated water and wastewater effluent.
19	Sanitation and waste management	The Project commits itself to manage domestic waste in sustainable manners i.e. reduce, reuse and recycling (3Rs) in order to diminish quantity of waste and the spaces for disposal. The Project commits itself to manage the waste in accordance with <i>The Public Health Law 1972 and The National Health Policy 1993</i> .
20	Storage and Transport of Petroleum	The Project commits itself to store and transport of Petroleum fuels in accordance with <i>the Petroleum Act 1934 and the Petroleum Rules 1937</i> .
21	Green House Gases Emission	The Project commits itself to promote reduction of the Green House Gases by the Project activities and the establishment in accordance with the current Myanmar Green House Gases Policy
22	CSR Program	The Project commits itself to reserve and conduct Cooperate Social Responsibility (CSR) program base on the yearly profit. The project will donated for education such as scholarships donation for young people who live in villages nearby the Township and to support the nearby villages in Emergency such as Fire or Natural disasters.
23	Insurance	The Project commits itself to effect compulsory general liability insurance with the Myanmar Insurance, if the Project may cause damage to the life and property of public or cause pollution to the environment, in accordance with <i>The Myanmar Insurance Law 1993, Section 16</i> .
24.	Compensation	The Project commits itself to pay effective compensation for loss incurred, if the Project causes damage to the natural environment and causes socioeconomic losses, according to <i>The Environmental Conservation Law, Section 7(o) and The Investment Law 2016, Section 66</i> .
25.	ISO 14001	The Project commits itself to develop ISO 14001 for better compliance with environmental protection and conservation for sustainable environment.
26	Environmental Management and Monitoring Plans	The Project commits itself to develop and implement all the updated EMPs and EMoPs during construction phase, operation phase and decommissioning phase.

### **3.5.2 Environmental and Social Management Commitments**

The Project Proponent is committed to develop the project in the sustainable principles and will be managed in accordance with the international standard, ISO 14001 Environmental Management System (EMS). The ISO 14001 EMS will be integrated in parts of the project and all environmental aspects will be managed in manner to accomplish the requirement of the system.

In first step, the project will formulate an environmental and social policy as guidance for project management, either during the construction and operation phases. The policy will sustain by the following activities:

- Develop a comprehensive Environmental, Health, and Safety (EHS) Management Plan and implement in the Environmental Management Plan (EMP);
- Implement of the EMP as a part of the project and manage the operation with due diligence. Environmental auditing will have to be conducted in an appropriate interval;
- In construction phase, the nominated EPC contractors are required to perform the Environmental Management Plan (EMP) in the contract that specify EHS measures;
- In operation phase, the EHS management will be integrated as a part of the operational management of the project;
- Establish adequate environmental and social safeguards and capabilities;
- Encourage public participation in the EHS management and related to the surrounding communities; and
- Maintain information in the EHS management and performance of the EHS reports required by the corporate management, Government and the concerned authorities.

The EHS Management will be activated starting from the commencement date of the construction.

## CHAPTER 4 PROJECT DESCRIPTION AND ALTERNATIVES

### 4.1 PRESENTATION OF THE PROJECT

#### 4.1.1 Project Description

##### 4.1.1.1 Project Location

Initial Township is located in Dawei Special Economic Zone (DSEZ) (Figure 4.1-1 and Figure 4.1-2). It is approximately 28 kilometers north of Dawei Province in the southern part of Myanmar.

#### ***DSEZ Demarcation***

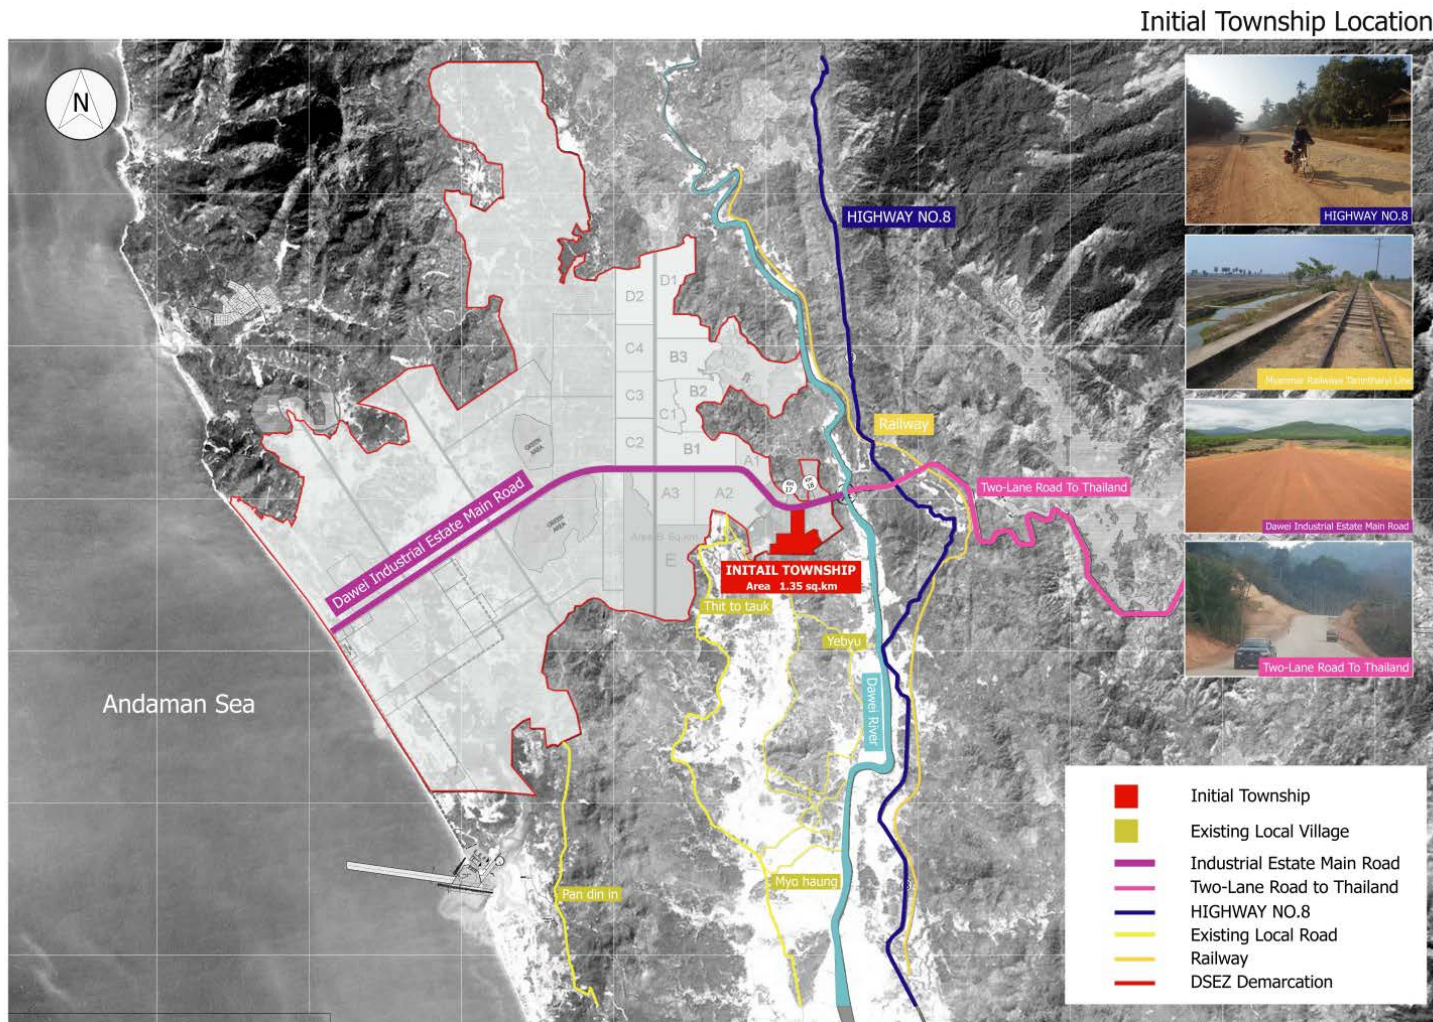

Source: DRC (2015)

**Figure 4.1-1 Location of Dawei Special Economic Zone and the Township Project**

##### 4.1.1.2 Project Accessibility

Highway no.8 and two-lane road to Thailand are the nearest accessibility (Figure 4.1-2). The highway no.8 is a national highway of Tanintharyi Region that connects northern and southern parts of Myanmar together, between Myaik, Dawei, Mawlamyaing and Yangon. The Two-lane road to Thailand linked with main road of the DSEZ and Kanchanaburi, Thailand. The Project entrance can be accessed by this road at KM 17.

Source: DRC (2015)

Figure 4.1-2 Initial Township Location and Accessibility

#### 4.1.1.3 Project Background

Development of the project was officially commenced in 2008, when the Memorandum Of Understanding (MOU) was signed between two governments, Thailand and the Union of Myanmar, agreeing to develop the deep sea port in Dawei. In 2010, ITD was granted right from the Myanmar Port Authority to develop and operate Dawei Project over a 75-year land lease period. Key milestones of the project development history are summarized in Table 4.1-1.

**Table 4.1-1 Summary of Development History of the Project**

Date	Description
May 19, 2008	Government of the Kingdom of Thailand and the Government of the Union of Myanmar signed an MOU to develop a deep sea port in Dawei.
June 12, 2008	Myanmar Port Authority as authorized implementing agency and ITD signed an MOU relating to the implementation of a feasibility study and comprehensive project site for the Dawei Deep Sea Port and Industrial Estates Development Project.
November 2, 2010	The Framework Agreement was signed by Myanmar Port Authority and ITD granting ITD rights to develop and operate. The Dawei Project cover 75 years land lease period.
June 25, 2012	The Ministry of Finance of Thailand authorized a working group in order to provide financial support for the Development of Dawei Deep Sea Port and Industrial Estate Project. The Chairman of the working group is the Director of the Fiscal Policy Office. The working group consists of representatives of the Office of the National Economic and Social Development Board (NESDB), the Export-Import Bank of Thailand (EXIM Thailand), the Office of the State Enterprise Policy Committee and other government representatives.
July 23, 2012	The Government of the Kingdom of Thailand and the Government of the Republic of the Union of Myanmar signed an MOU on the Comprehensive Development of the Dawei Special Economic Zone (DSEZ) and its related project areas in order to further enhance the two government's support and cooperation of the Dawei Project.
November, 2012	The Thailand- Myanmar Joint Committee for the Comprehensive Development in the Dawei Special Economic Zone and its related Project Area was established into 3 levels in order to manage and enhance the Dawei Project development namely: Thailand-Myanmar Joint High-level Committee (JHC), Thailand-Myanmar Joint Coordinating Committee (JCC) and Thailand-Myanmar Joint Sub-Committee (JSC) which has 6 infrastructure sectors for development including: Infrastructure and Construction, Focuses Industry and Business Development, Power, Community Development and Relocation, Rules and Regulations and Finance.

**Table 4.1-2 Summary of Development History of the Project**

Date	Description
Year 2013	The concession of Dawei Project had been suspended following by Terminal and Tripartite agreement, Thailand and Myanmar have agreed to revise all development projects in Dawei to make them more realistic and attractive for foreign investment and become to the present Dawei Special Economic Zone Initial Phase Development Plan in order to manage the port, road and rail links, power plants, waterworks, industrial estates, telecommunications and a township. Developer has awarded from the Dawei Special Economic Zone Management Committee (DSEZMC).
June 17, 2013	The Special Purpose Vehicle (SPV) was established by the 2 governments primarily holding 50% shareholding each in the SPV. The SPV will be a concessionaire to develop, manage and promote the Dawei Project. The Myanmar and Thai governments are represented by the Foreign Economic Relations Development (FERD) and the Neighboring Countries Economic Development Cooperation Agency (NEDA) respectively. Both governments plan to invite other countries to join the SPV to develop and manage the Dawei Project accordingly
August 2014	DSEZMC released TOR of Dawei SEZ Initial Phase Development. The 4th JCC Meeting held at the Centara Grand Hotel Bangkok, the New Framework Agreement between the DSEZ Management Committee and Dawei SEZ Development Co., Ltd ("SPV") was signed. This agreement gives the right to the SPV to be the promoter and facilitator of the Dawei Project and grants the right to the SPV to invite and select the investment groups for the Special Purpose Companies (SPCs) for the relevant infrastructure as well as the concessionaire for the Initial Phase of the Dawei Project.

Source: DRC (2015)

#### 4.1.1.4 Phase Development

Initial phase of Township covers an area of 1.365 sq. km in DSEZ. It is designed for maximum capacity of 135,080 persons in order to accommodate workforce from Initial Industrial Estate. At the present, the Township will be developed on demand basis; however, the Township can be further expanded up to 5.58 sq.km in final phase.

Development of the Initial Township will be by phases. To begin with phase 9+1 and then phase A, B, C and D will be developed, respectively. Development plan is presented in Table 4.1-2.

##### **(a) 9 plus 1 Phase**

Development of the Initial Township will begin with phase 9 plus 1. Nine buildings of Workforce apartment and one Service apartment will be built at this stage. Basic need infrastructure e.g. Township main road, water and power supply will also be constructed. Location of phase 9 plus 1 is in Figure 4.1-3.

**Table 4.1-3 Project Development Phasing**

Year	Phase	Construction Plan					
		5-Floor Workforce Apartment (700 Pers./Bldg.)	Capacity (Pers.)	8-Floor Serviced Apartment (222Pers./Bldg.)	Capacity (Pers.)	3-Floor Retail Shops (120 Pers./Bldg.)	Capacity (Pers.)
2015	9 + 1	9	6,300	1	-	0	0

2021		23	16,100				
2022	D	17	11,900				
<b>SUM</b>		<b>176</b>	<b>123,200</b>				

Figure 4.1-3 Location of Phase 9 Plus 1 and Layout of Full Phase.

**(b) Full Phase**

Initial Township will be entitled with residential buildings, infrastructure and facilities in full phase. Infrastructure are Road Network, water and power supply and Flood Protection System. Facilities are recreation; public and green area, commercial venue, transportation hub, fire station and police station. These facilities will be developed by phases in accordance with the mentioned plan until completion. Supporting facilities are such as health center or hospital and school will be built at the time that adequate number of population has been reached.

**4.1.1.5 Project Schedule**

Construction and development of infrastructure are scheduled to start in 2015 or as soon as possible after the EIA approval and finish in 2023. Overall project schedule is shown in Table 4.1-3.

Table 4.1-4 Overall Schedule for Development of Initial Township

#### 4.1.2 Project Components

The Project constitutes residence, commercial venue, facility center and infrastructure. These features has been designed to serve up to 135,080 people and they are as follow:

##### 4.1.2.1 Land and Landscape

Initial Township has been designed base on it nature and primitive topography with the aimed concept that topography will be minimal altered and sustain with the environmental setting of the township. In this study, topographic analysis and land grading technique are integrated in layout of the township, to resolve a number and type of buildings in accordance with life style of residents and the buildings themselves concepts along with the topography and landscape as shown in Figure 4.1-4 to Figure 4.1-5.

Figure 4.1-4 Topography Analysis

**Figure 4.1-5 Conceptual Land Grading**

**(a) Zoning and Grid Network**

The township will consist of three main areas, residential, commercial, recreational and green area. To harmonize these areas together with life style of the communities, road connection and grid network have been designed, not only to accommodate the residents in relation to their environment but also energy efficiency as shown in Figure 4.1-7.

Commercial and retails areas will be located in between the Service Apartments and the Workforce Apartment to reduce separation and enhance relationship between the residents. In addition, the building blocks are designed base on walking distance. A Typical Block, 165 meter x 150 meter will be able to walk with rate of 3.2 kilometer per hours (estimate 0.7 meter per step of walking) as shown in Table 4.1-6.

Walking Distance

**Figure 4.1-6 Typical Block Concept**

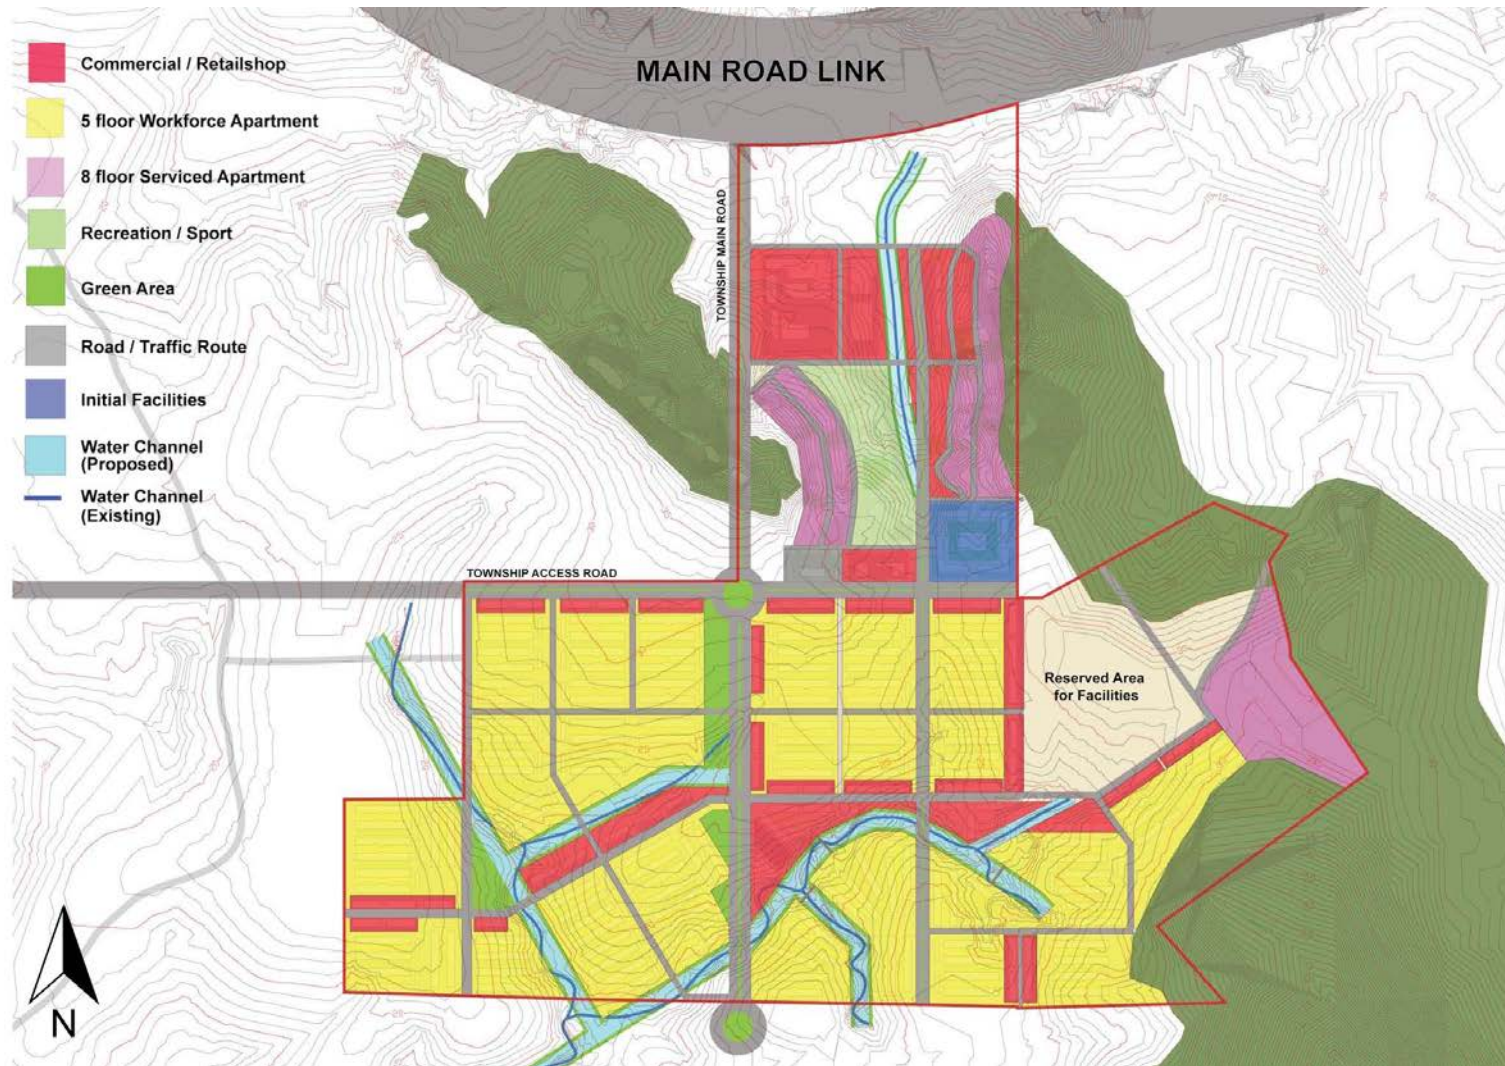

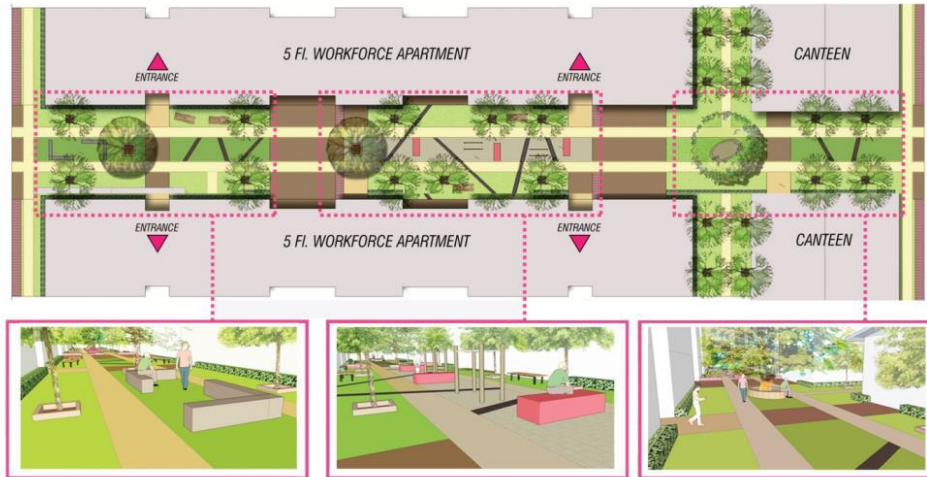

Figure 4.1-7 Zoning of Initial Township

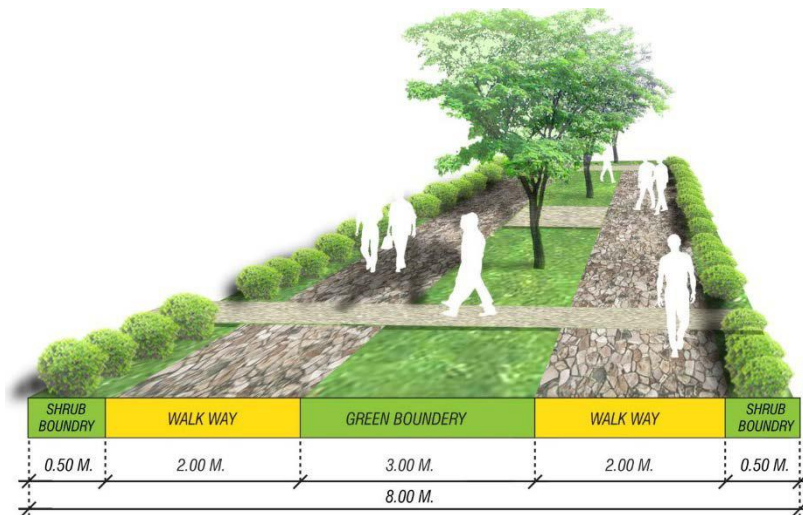

**(b) Recreational and Green Areas**

In order to provide sustainable community lifestyle for the residents, various types and scales of public parks are employed to create continuous green area all over the town. The smallest scale of recreational areas will start from the space between 2 buildings and continue the connection into scale of blocks, districts and town as shown in Figure 4.1-8 and Figure 4.1-9.

**Figure 4.1-8 Green Area Between Walk Ways**

**Figure 4.1-9 Walk ways and Green Boundaries**

Total green area is about 0.7 square kilometers. Green areas location (in Figure 4.1-10) will be developed by phases per extension units of the Project, to support increasing of population in each area such as outdoor, indoor, jogging areas, sport and picnic Figure 4.1-11 .

Figure 4.1-10 Green Areas

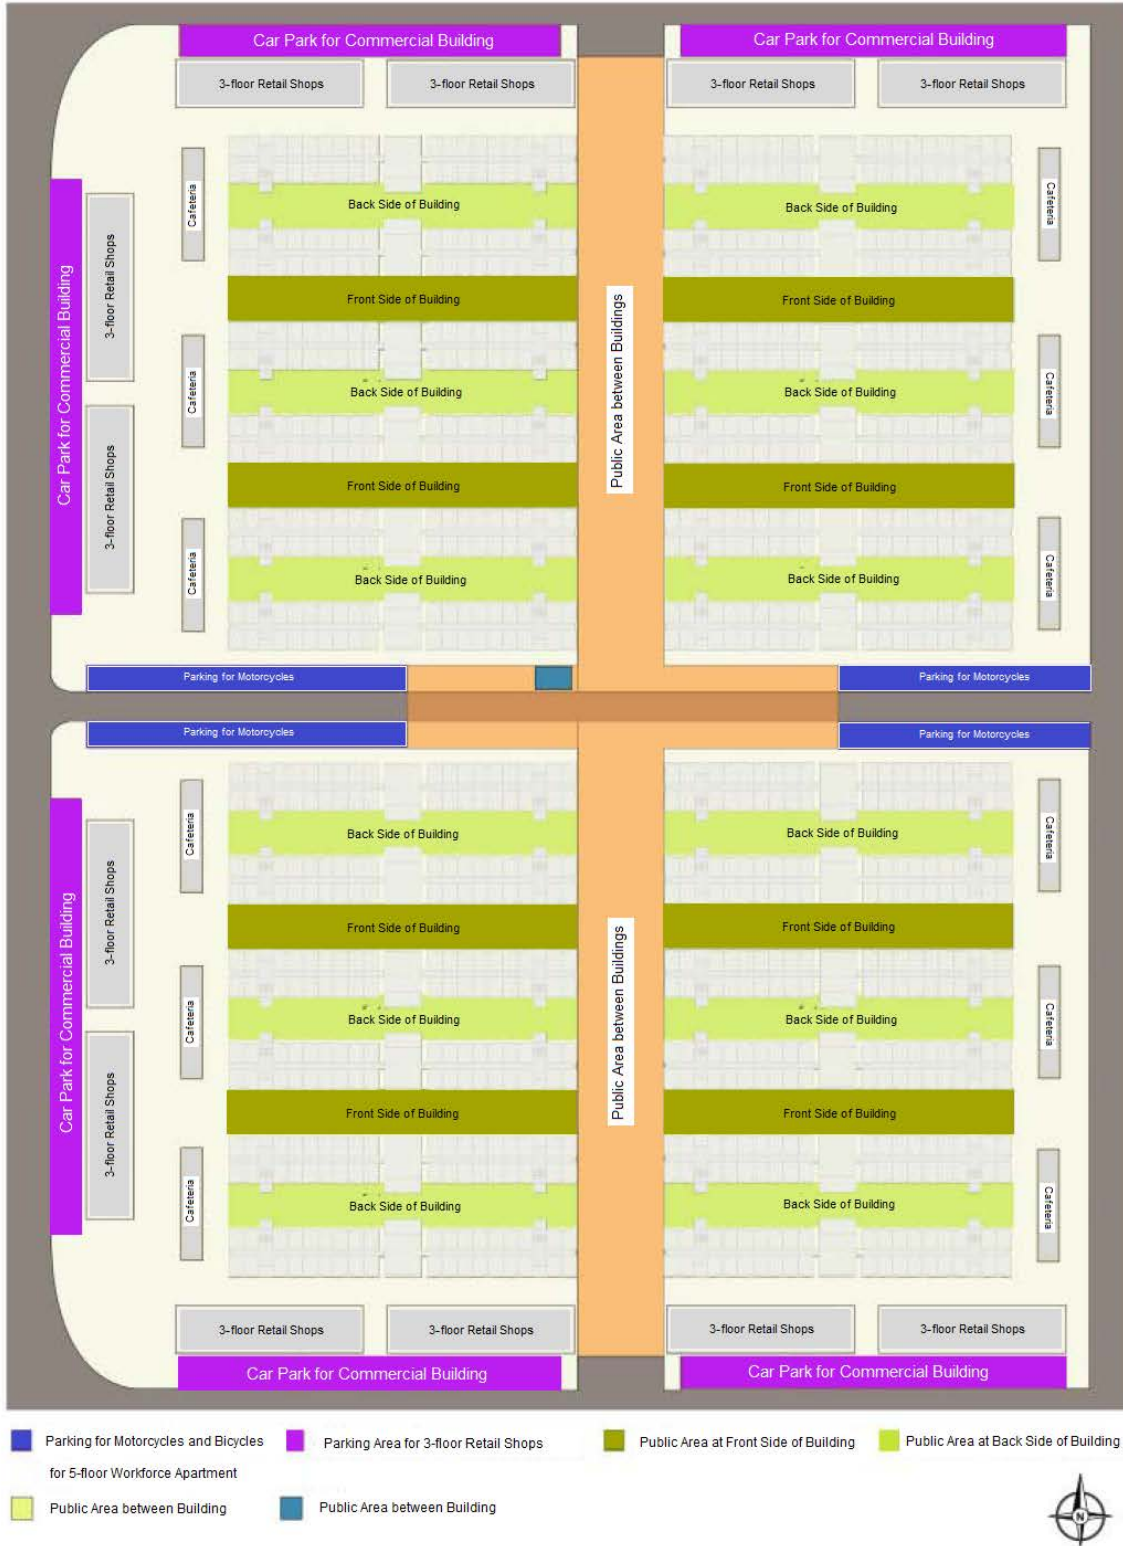

Figure 4.1-11 Development of Park and Recreational Areas.

**(c) Public Areas**

Public areas are parking, areas between building (both front and back) and common cafeteria. Every 3-floor retail shops have their own parking port in the front. Motorcycles parking ports are shared and in between the blocks as shown in Figure 4.1-12.

**Public Area**  
Green Area / Car / Motorcycle / Bicycle

**Figure 4.1-12 Public Areas**

#### **4.1.2.2 Residential Buildings**

Residential buildings are 5-floor workforce apartments, 8-floor serviced apartments (Managerial Class) and 3-floor retail shops at international living standard for its residents. Details of building are shown in Table 4.1-4.

##### **(a) 5-floor apartment**

The 5-floor apartment or 5-storey workforce apartment is an accommodation design for workforce. The main propose is for labor or employee who will regularly work in the plants or factories in the Initial Industrial Estate. The room is typical shared accommodation or dormitory type, which the residents have to share bathroom, lavatory, laundry, kitchen and common area etc. Inside a room is approximately 20 square meter and consists of 4 beds (Figure 4.1-13 to Figure 4.1-18).

##### **(b) 8-floor apartment**

The 8-floor apartment or 8-storey service apartment is an accommodation designed for executive and his/her family who also work in the plants or factories of the initial Industrial Estate or in DSEZ vicinity. The room is typical private accommodation or "Condominium" style. The apartment consists of approximately 100 units. The 1-bed room units ranging from 34 to 54.5 square meters and there are three different types of the room, Studio, Deluxe type 1 and Deluxe type 2 (Figure 4.1-19 to Figure 4.1-22 ).

##### **(c) 3-floor retails shop**

The 3-floor apartment or 3-storey retail shop is a combined feature of building for commercial and residence. First floor is designed for commercial purpose as retails and the 2<sup>nd</sup> and the 3<sup>rd</sup> floor may be used for residence of the other business purposes. Up to 4 meters wide and over 10 meter in length of useful space for each floor with parking area in the front (Figure 4.1-23 to Figure 4.1-27).

#### **4.1.2.3 Commercial Buildings**

Commercial areas consist of shops and restaurants. The venue is designed for commercial purpose including public area e.g. canteen for public activities. Pavement in this area will be ground blocks for multi-purpose in case emergency (Figure 4.1-28 to Figure 4.1-29)

Figure 4.1-13 Layout of 5-Floor workforce apartment

### LOCAL TOWNSHIP APARTMENT

The majority of residents in Local Township come from the workforce in Dawei Industrial Estate. The Local Township Typical Residential Design is a 4 storey apartment building with public area in the center.

The design and construction are based on "ENERGY CONSERVATION CONCEPT": Building orientation, Cross ventilation and Sunlight stack in order to sustainably maintain the long-term well being of the tenants.

#### TYPICAL RESIDENTIAL BLOCK

Apartment units  
 Commercial units

Every 2 apartments come with 1 canteen which capacitate 100 tenants a time. The Canteen has functions of kitchen, pantry and wash area in order to let the tenants use for daily meals and feasts.

Room Type: Studio  
 Unit area: 20 sq.m.  
 Tenants: 2 people / unit  
 Apartment Type: 4 storey  
 112 units / apartment  
 224 tenants / apartment

There are Public Use Areas such as: Bathrooms, Laundry Yard for every floor. The layout is designed with the crisscross system in order to let each floor gain most of the sunlight during the day.

The walkway in the middle of the building is applied with the light&ventilation stack system. This system helps the coridor get more light and ventilation in order to reduce daily energy consumption. There is also a small green space in front of each unit for planting.

#### **4.1.2.4 Facilities Center**

##### **(a) Hospital**

Location of the hospital or health center will be in public facility area (See Figure 4.1-30). The hospital will be 60 beds covering 25 Rai or 40,000 square meter and can serve up to 50,000-100,000 people within 15 kilometers. The hospital will consists of treatments, cares and examination area, administration, technical and storage zones, waste discharge or management and external areas: park and parking, will be design in accordance with international standard. The hospital will be built, once population of the Township has reached certain number. Initially, the Township residents will rely on the Dawei Hospital (local hospital).

##### **(b) Police Station**

Location of police station will be in public facility area. The police station can service over 5,000 to 10,000 Rai in radius of 15 kilometers.

##### **(c) School**

Location of school will be in public facility area. The school type, primary school, secondary school and high school will rely on size of population in demands. The school is expect to have 600 to 1,000 students and to service in 1.5 kilometers in radius.

##### **(d) Fire Station**

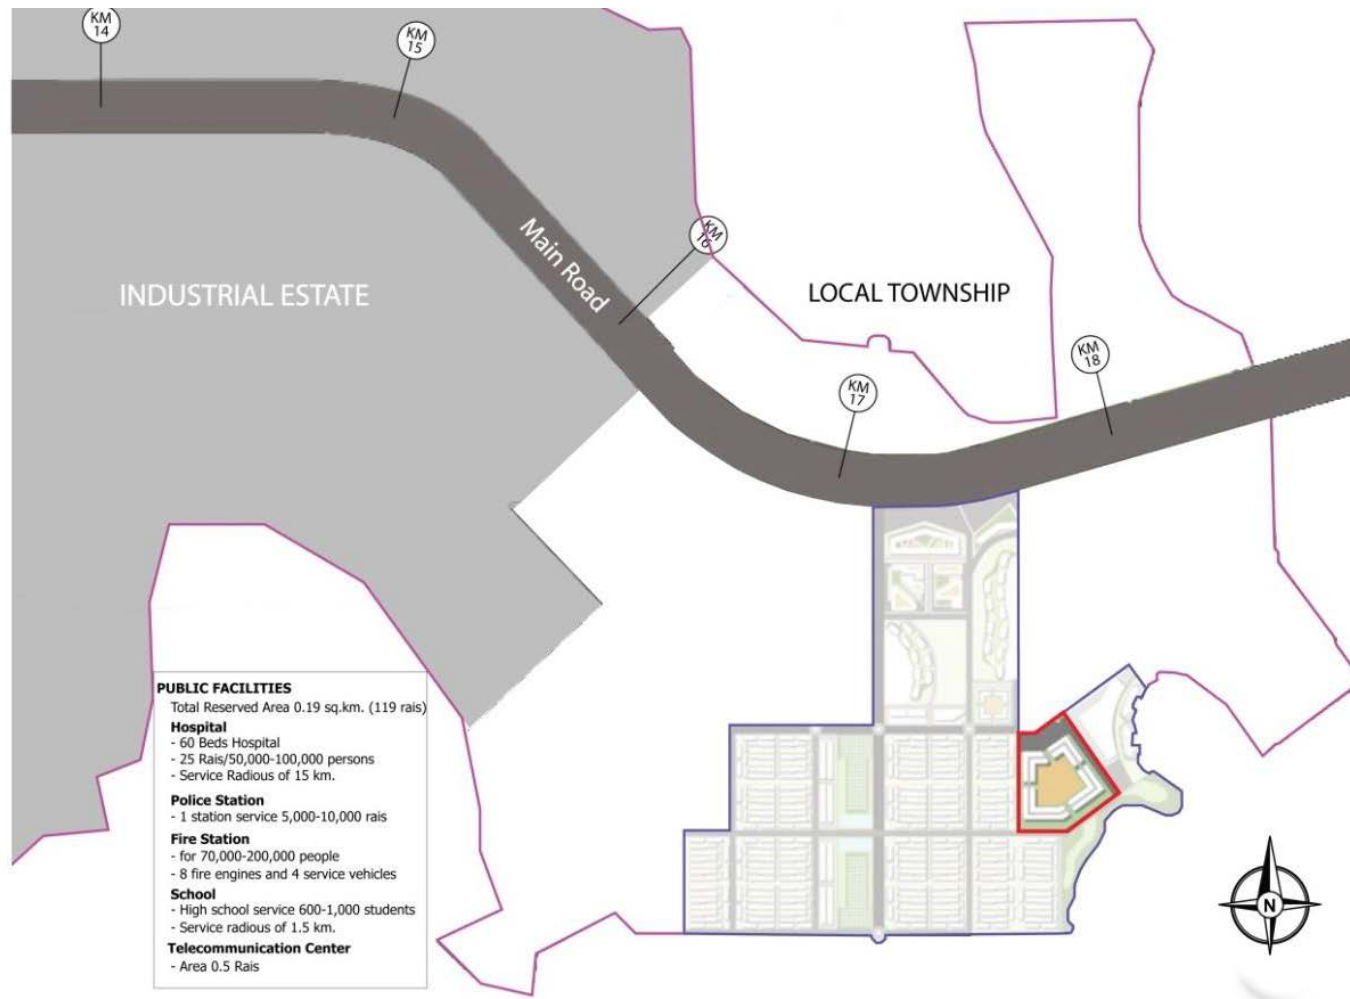

Location of fire station will be in public facility area. Fire station will includes with fire equipment, fire trucks, fire apparatus including fire brigade staff. Details of fire station are in *Section 4.1.14, Fire and Emergency Response System*.

##### **(e) Telecommunication Center**

Location of telecommunication center will be in public facility area. The center will cover only 0.5 Rai in service.

##### **(f) Transportation Hub**

Location of transportation Hub will be in residence area in between service apartment zone 1 and workforce apartment zone 1. It will cover 16,000 square meters.

Source: DRC, 2015

Figure 4.1-30 Location of Public Facility in Initial Township

### 4.1.3 Road Network

Due to shape of the Project land, is fan-shape, grid system (Figure 4.1-31) is applied to the Project with multiple accesses, to facilitate residents and prevention of traffic congestion. Grid system is also applied in areas of workforce apartment that are equally divided into blocks and size of these blocks are all in walking distance, to ensure that residents can get off the bus and continue walking to their accommodation. For gated type of community such as serviced apartments, there will be only one or two accesses. This is due to increasing level of privacy and safety.

Road and grid network are 3 types as follows;

- tertiary road is 2-lane,
- secondary road is 4-lane,
- main road is 6-lane.

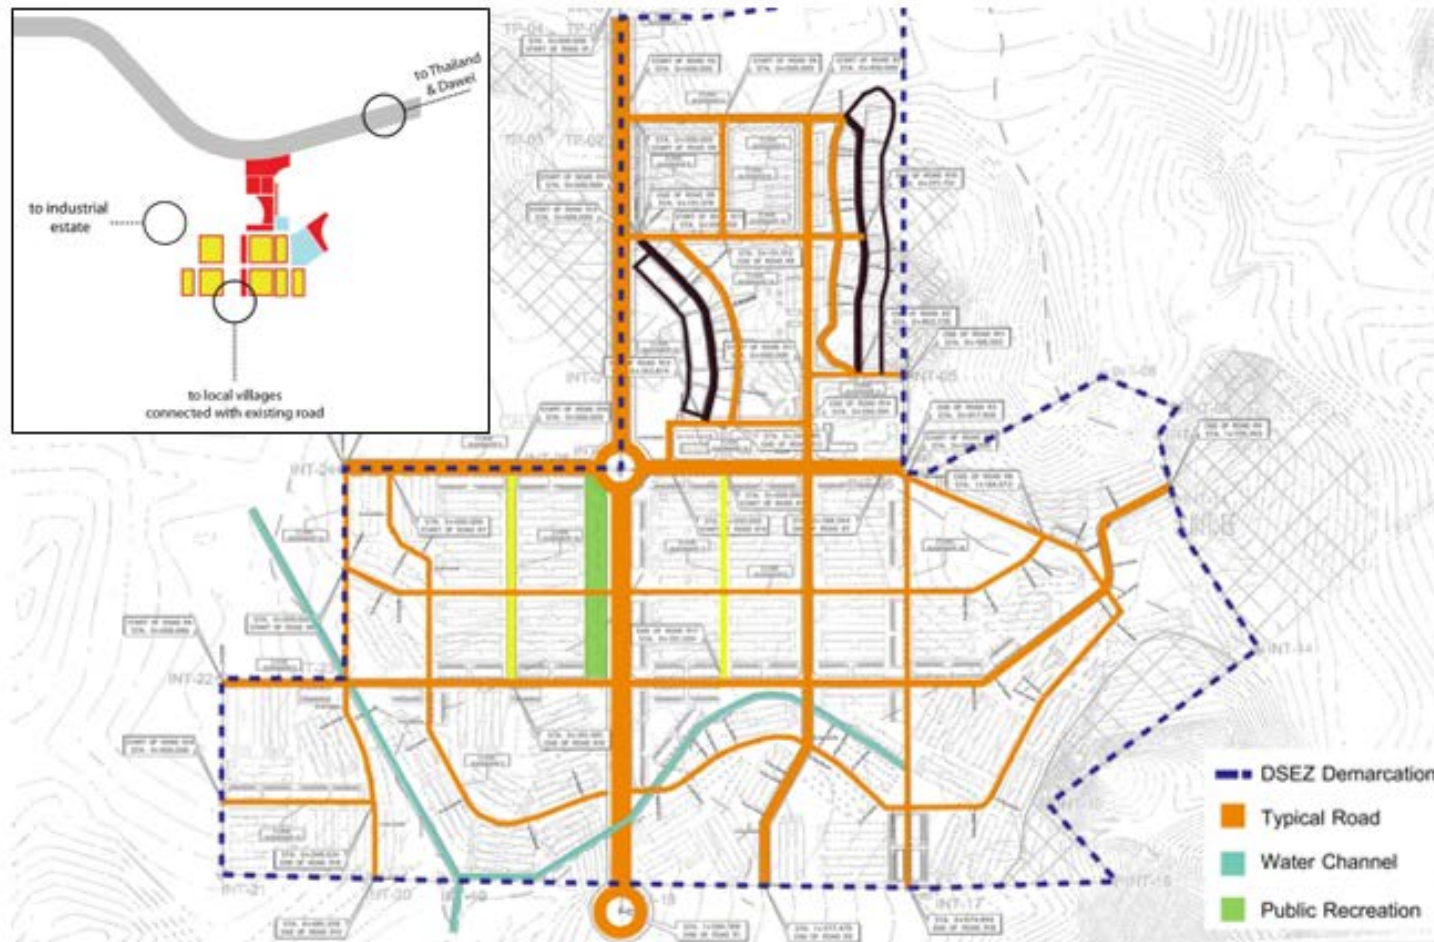

Typical cross- sections of the secondary and tertiary roads are shown in Figure 4.1-32.

### 4.1.4 Flood Control and Drainage System

The existing topographic condition of the Dawei SEZ consists of 2 drainage basins. The Andaman basin is on the west and the Dawei basin is on the east (Figure 4.1-33). The Initial Township is situated in upstream area of the Kun Chuang River, which is in sub-basin of the Dawei basin. The Project is not in the area of seasonal flooding but downstream area of the Kun Chuang River is. From a field investigation revealed that flood marks in 2006 was up to 13 meters above Chart Datum (CD). The extent of the flood is shown in Figure 4.1-33.

According to the site characteristic and heavy monsoon season at the site, the adjusted terrain and drainage are designed by marking steps upon natural terrain in order to gain the most benefit from its context. Each slop area will be adjusted into steps will circa 1 m. height difference, to create smoother walkable topographic scene all over the site. It will focus on how the building would be on actual topographic condition and how the new shaped terrain would drain the rainwater effectively.

Roads are attached with sized sewers that will drain rainwater into drain cannel. For every mountainous area, an adequate size of green stripe will be grown in order to retain the Dawei heavy rainfall. These stripes will help to absorb and transfer rainwater as shown in Figure 4.1-34.

Figure 4.1-32 Typical Cross-sections of Tertiary Road, Secondary Road and Main Road in Township

Owing to area of the Project is situated in quite altitude. Only retention ponds are designed to hold a certain volume of water from rain in case of periodically flood. One retention pond is for area north in the initial township and the others, two retention ponds are designed for the full phase. Location of the retention ponds are presented in Figure 4.1-35. Volume of each retention ponds is presented in Table 4.1-5

**Table 4.1-6 Volume of the retention ponds for the Initial Township**

	<b>Township Phase</b>	<b>Location</b>	<b>Volume of retained water (m<sup>3</sup>)</b>
Retention pond TW1	Initial phase	North	12, 720
Retention pond TW2	Full phase	Southwest	21,310
Retention pond TW 3	Full phase	Southeast	19,590

Design of the retention ponds is based on retaining time (Tc). The retention ponds are designed for holding rainwater for 6 hours. Rainfall intensity and the return period of flooding can be determined by the IDF curve. Maximum rainfall collected within 6 hours in the 50 years cycle of the returning period is 46.5 mm. Design of the three retention can be summarized in Table 4.1-6.

**Figure 4.1-33 Historical Flood Extent in Dawei Special Economic Zone in 2006**

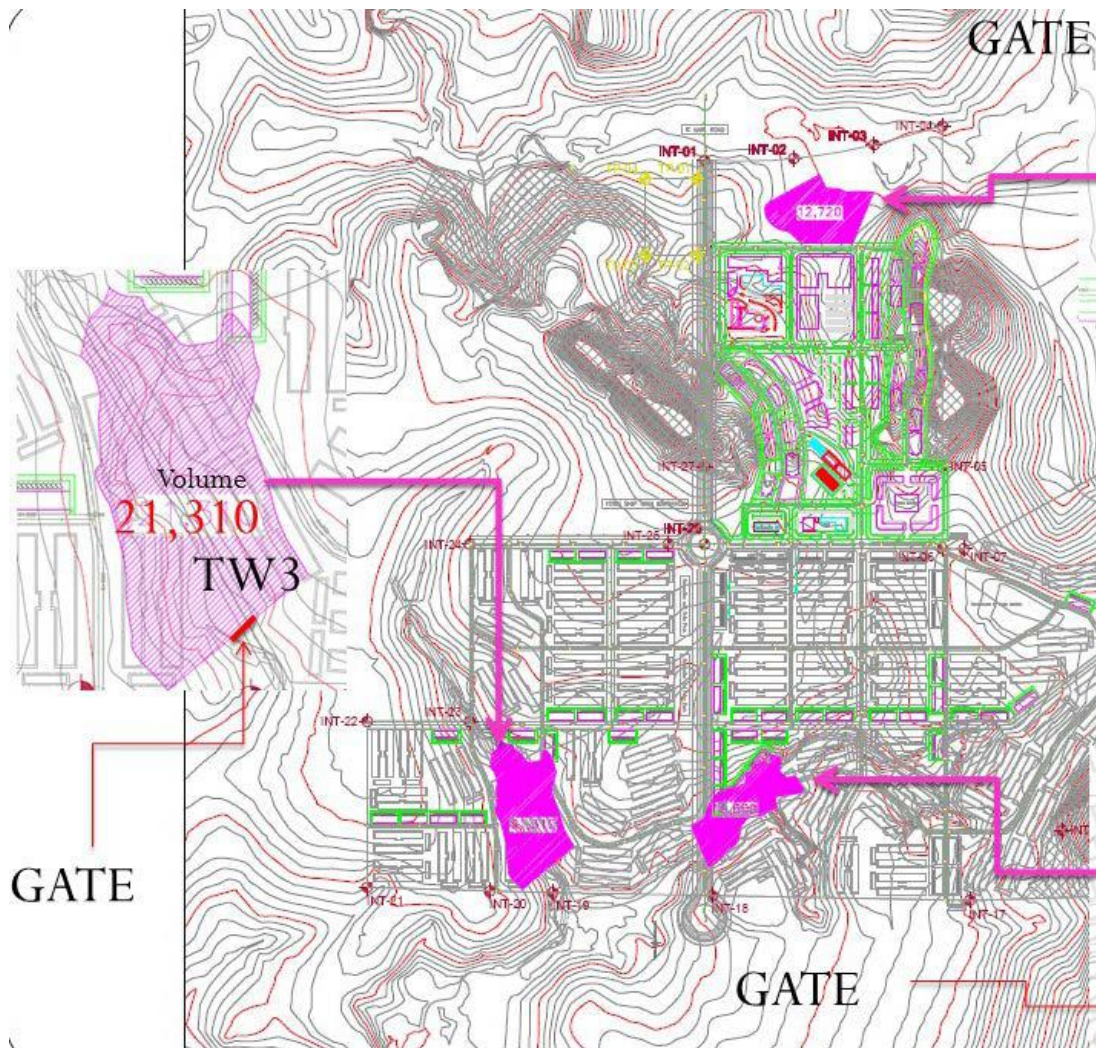

Figure 4.1-34 Cross Section of Flood Control Area

Table 4.1-7 Design of Retention Ponds in Township

DESIGN RETENTION POND		
duration	6 HR	Rainfall collection 46.45 mm
Zone	Area of Zone	Volum for Retention pond
	m <sup>2</sup>	m <sup>3</sup>
Retention pond TW 1	381,437.960	12,720
Retention pond TW 2	582,473.227	19,590
Retention pond TW 3	639,139.803	21,310

Source: SEATEC (2012)

As presented in Figure 4.1-35, each retention pond will consist of one control building area, one pump station and intake structure with sluice gate. Submersible axial pumps are 3,200 CMH at 6.5 M. TDH with 75 KW of motor.

Source: DRC (2015)

**Figure 4.1-35 Location of Retention ponds of Township**

#### **4.1.5 Power and Electricity Distribution System**

The electricity demand for 8-floor serviced apartment and 5-floor workforce apartments is 9,036 and 37,800 VA respectively.

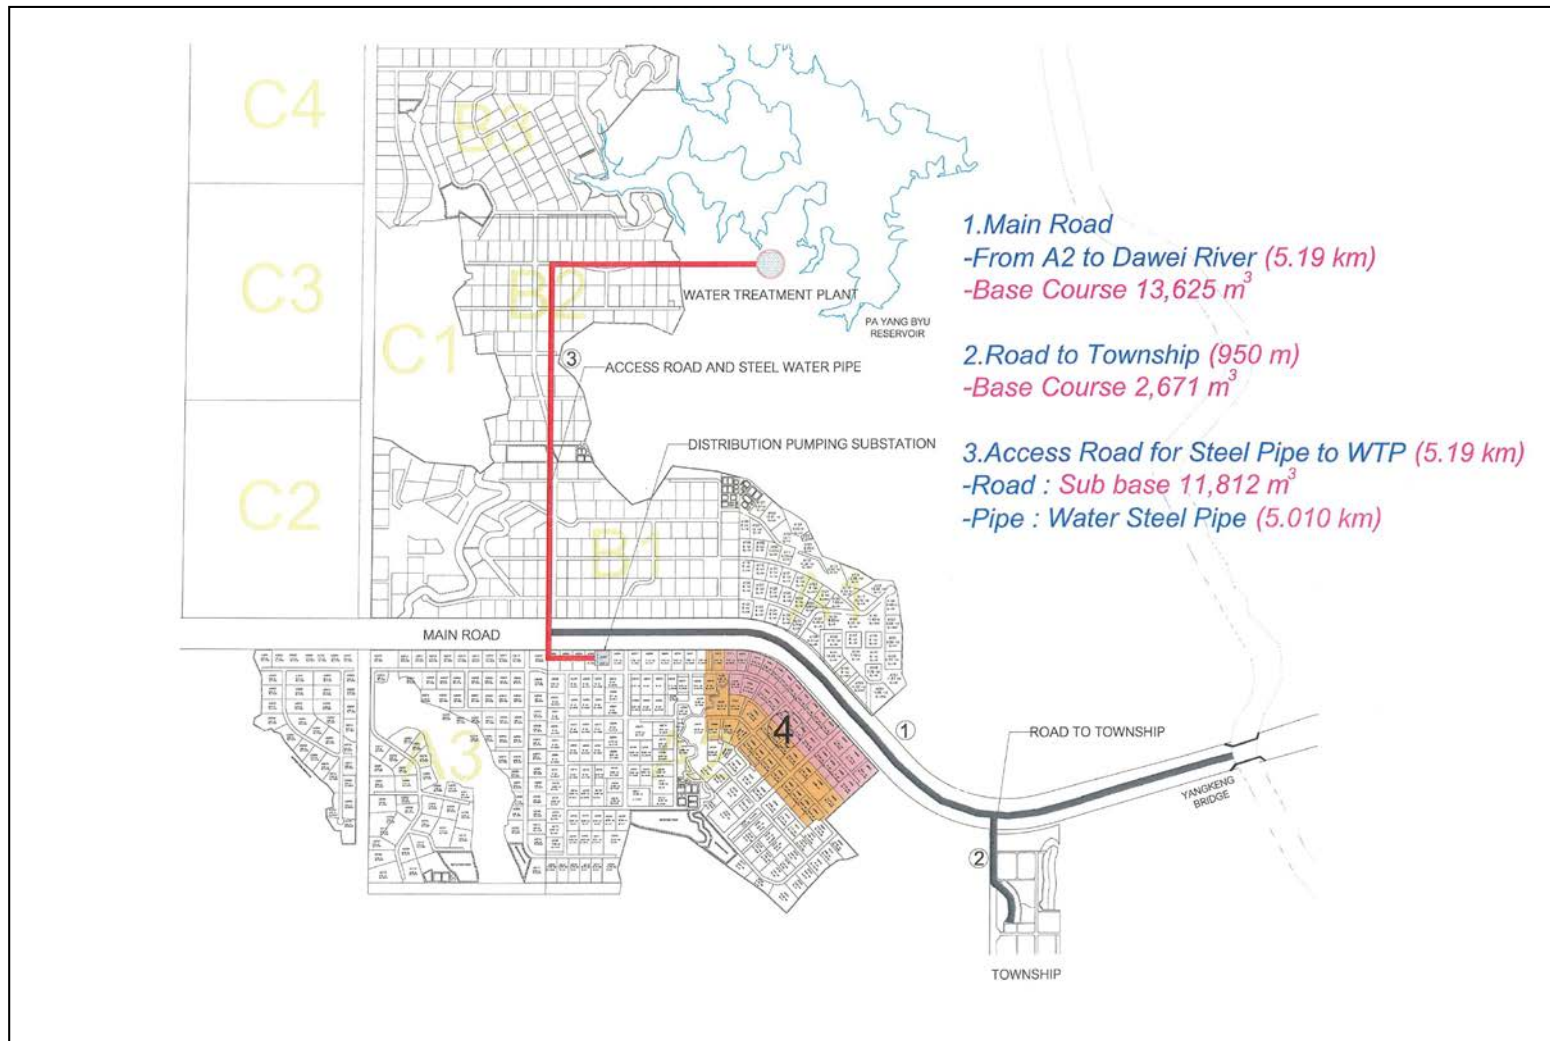

#### **4.1.6 Water Treatment and Distribution System**

Raw water source for Initial Township is from the small reservoir, Pa Yin Byu. The reservoir is established to supply water to both Initial Township and the initial Industrial Estate. Amount of water supply is estimated and predicted to be sufficient enough and stable for future consumption, with maximum capacity of 8.54 million cubic meters. Details of the Pa Yin Byu is in Annex 4-1.

The raw water will be treated at water treatment plant which is located near the reservoir and is a part of Initial Industrial Estate facility. Treated water will be distributed via the

steel pipeline underneath the access road to the distribution station in Zone A2 of the Initial Industrial Estate and then distributed along the main road until at km. 17 and km 18, it is diverted to the Initial Township as shown in Figure 4.1-36.

Alternatively, groundwater resource may be used; however, groundwater quality are quite not good in its quality. Analysis from the existing wells, groundwater are slightly brackish and water is quite acidic. Most of wells have pH ranging between 4.7 and 6.2 and some wells have cadmium and zinc over the standard. Use of groundwater as raw water may be needed extra treatment from routine surface water treatment.

Source: DRC (2015)

**Figure 4.1-36 Water Treatment and Distribution System in Initial Township**

#### 4.1.7 Wastewater Treatment System

Septic tank (Onsite Treatment Unit) with the capacity of 90 m<sup>3</sup>/d is prepared to treat wastewater from 5-floor workforce apartment and the capacity of 54 m<sup>3</sup>/d is prepared to treat wastewater from 8-floor serviced apartment. Required levels for effluent for different types and sizes of the buildings are summarized in Table 4.1-7 and Table 4.1-8.

**Table 4.1-8 Required Quality of Wastewater from Septic Tank Initial Township Wastewater Treatment Systems**

Parameter	Unit	Range or Maximum Permitted Values for These Categories					Method for Examination
		A	B	C	D	E	
1. pH	-	5-9	5-9	5-9	5-9	5-9	pH Meter
2. BOD	mg/l	20	30	40	50	200	Azide Modification at 20 °C , 5 days
3. Soilds							
- Suspended Soilds	mg/l	30	40	50	50	60	Glass Fibre Filter Disc
- Settleable Solids	ml/l	0.5	0.5	0.5	0.5	-	Imhoff Cone 1,000 cm <sup>3</sup> 1hour
- Total Dissolved Solid (TDS)*	mg/l	500*	500*	500*	500*	-	Dry Evaporation 103-105 °C, 1 hour
4. Sulfide	mg/l	1	1	3.0 -	4	-	Titration
5. Nitrogen as TKN	mg/l	35	35	40	40	-	Kjeldah
6. Fat, oil and grease (FOG)	mg/l	20	20	20	20	100	Solvent Extraction by Weight

Remarks: 1. Base on: Standard Methods for the Examination of Water and Wastewater recommended by APHA : American Public Health Association, AWWA : American Water Works Association and WPCF : Water Pollution Control Federation

\*= These values are in addition to the TDS of the water used.

10. Restaurants and food shops or food centers	2,500 m <sup>2</sup> or more	From 500 to not greater than 2,500 m <sup>2</sup>	From 250 to not more than 500 m <sup>2</sup>	From 100 to not more than 250 m <sup>2</sup>	Less than 100 m <sup>2</sup>

Remarks: Level of standard refers to the 6 parameters listed in the Building Effluent: Standard Values table  
 Source: Notification of the Ministry of Science, Technology and Environment issued under the Enhancement and Conservation of the National Environmental Quality Act, B.E.2535, published in the Royal Government Gazette, Vol. 111 special part 9, dated February 4, B.E.2537 (1994).

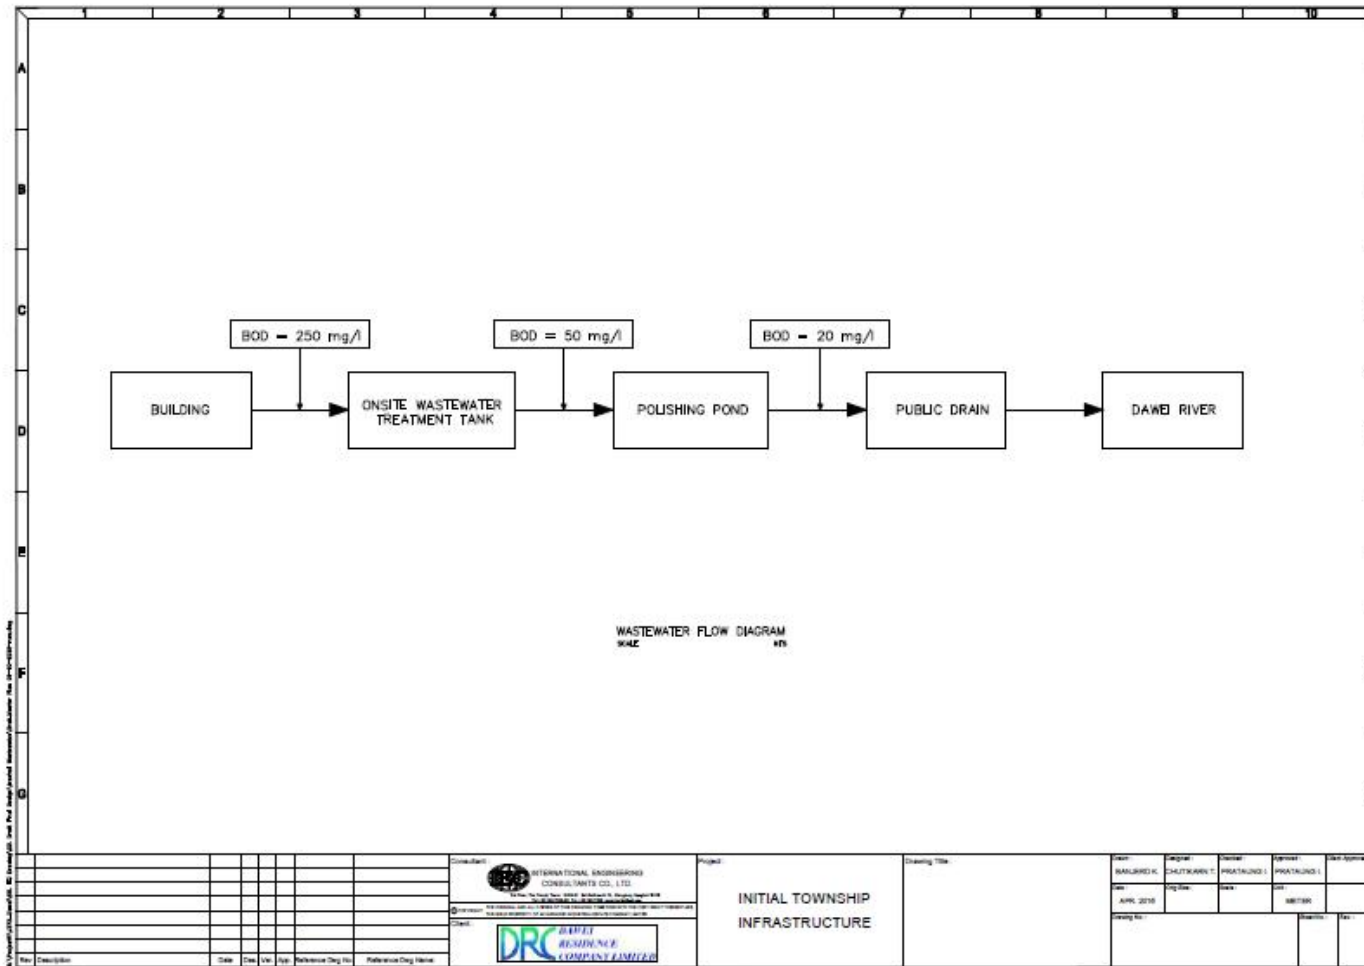

Location of Wastewater Treatment Plant is presented in Figure 4.1-37. Wastewater from the septic tanks will then be treated in polishing ponds before draining to public wastewater drainage. Effluent from polishing ponds in initial phase (area for North WWTP) will be discharged into Dawei river.

The wastewater in the polishing pond will be aerated to achieve the standard guideline for effluent at 20 mg/L of the BOD (Figure 4.1-38 to Figure 4.1-39). In case emergency, all the polishing ponds can hold the wastewater for 12 hours. In full phase of development of the Township, wastewater from southern area will be treated and then discharged in Kun Chuang River with the required effluent level of BOD 20 mg/L.

#### 4.1.8 Solid Waste Management System

##### 4.1.8.1 Waste Management

Waste generated from Project's activities, workers and sub-contractors will be managed according to the Dawei Waste Management Plan in Annex 4-2 which is the standard of municipal and industrial waste management, and concordance with the Pollution Control and Cleaning Department (PCCD) waste management policy and procedures.

The Project will implement mitigation measures that will conserve energy and the efficient uses about waste management in sequences such as Remove source, Reduce at source, Reuse, Recycle, Recover, Treat and Disposal. Besides, waste will be segregated or separated according to their characteristics. Basically, there are non-hazardous waste and hazardous waste, details are in Chapter 4, Solid Waste Management System and summarized below:

##### (a) Segregation and/or separation

All types of waste needs to be segregated/separated at source before disposal. The Project will provide segregation bins in color according to their characteristics follows

- Yellow bin is for non-hazardous (and dry waste) for recycling
- Blue bin is for non-hazardous (and wet waste) for non-recycling
- Red bin is for hazardous waste

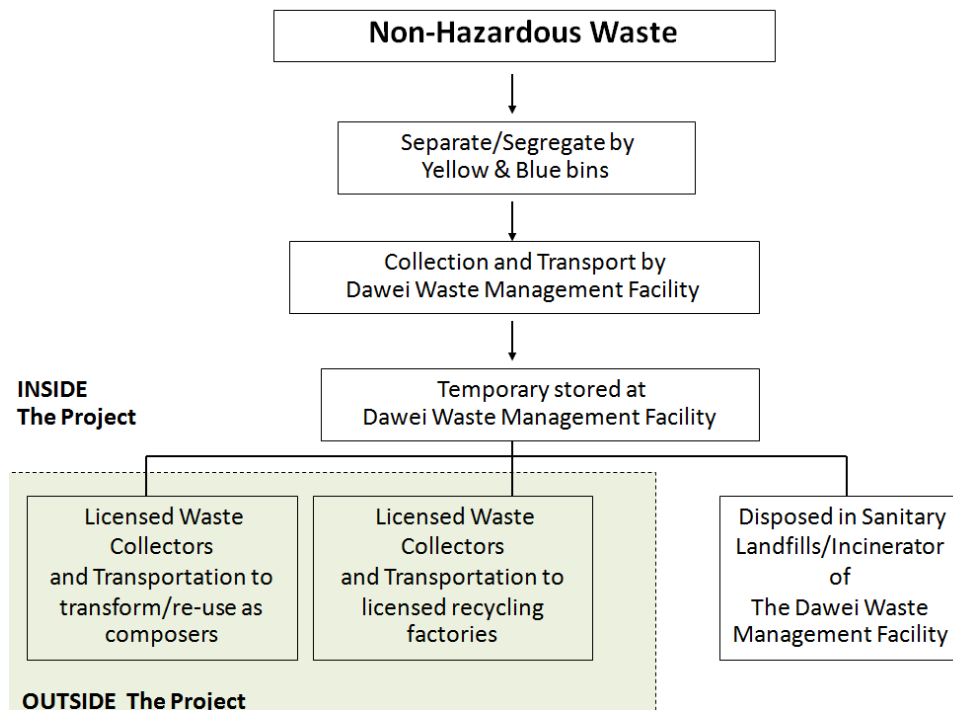

Figure 4.1-40 Segregating or Separating color bins for waste

Non-hazardous waste and recycling

are aluminum can, plastic bottles and paper etc. will be initially stored in the labeled yellow bins (Figure 4.1-40) and will then be collected and managed further for recycling. Duration of the storage will be around a week.

Non-hazardous waste and non-recycling

are such as food waste or plastic for food containers. The waste will be stored in the labeled blue bins before further management such as transformed the waste into compose or disposal. The waste will be collected daily and will be delivered to the Waste Management System (see details in Chapter 4) by licensed third party or Dawei Waste Management Center for disposal or transformation to the other materials (Figure 4.1-41).

**Figure 4.1-41 Management of Non-Hazardous Waste generated in the Project**

Hazardous waste

will be initially stored in red containers. Hazardous waste will be collected on bi-weekly basis and delivered to the Dawei Waste Management Facility. Handling of hazardous waste will require manifest and will be managed by licensed third party or the Dawei Waste Management Center itself (Figure 4.1-42).

**(b) Waste storage**

The waste will be stored in 200 liters of drums/ or appropriate containers according their hazardous characteristics at the center facility. Storage of hazardous waste will be complied by the relevant laws. Basically, the waste will be stored under confined and roof

buildings that lay on concrete floor, which having good sum pit to collect wastewater, and in good ventilated condition. The waste will be stored no more than 6 months before treatment and/or disposal in the hazardous waste landfills or incinerator of the Dawei Waste Management Facility.

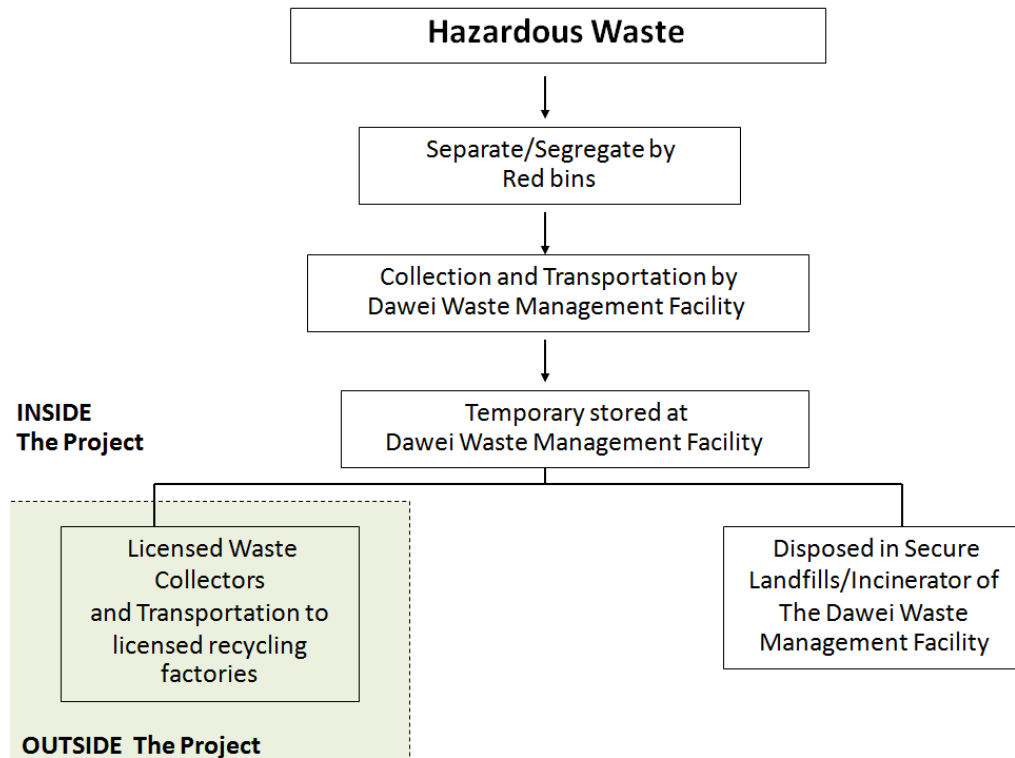

Figure 4.1-42 Management of Hazardous Waste generated in the Project

#### 4.1.8.2 Disposal Facilities

Solid waste management facilities are located in Zone A1 of the Initial Industrial Estate. The Project has undertaken the feasibility study of waste management e.g. landfills capacity in such long-term up to 50 years of the Project development. The research reveals that disposal in landfills will enable up to only 14-15 years due to space limitation of the Project disposal system. The total number of the landfills is only 10 and they will serve both from industry and township as presented in Figure 4.1-43. Afterwards, the Solid Waste Management Facilities will dispose all waste in the incinerators, which depends on their types, non-hazardous waste incinerator and hazardous waste incinerator.

Waste management and design of the disposal facilities are presented in Annex 4-2. The details include i.e. analysis of type and source of waste, rate of generation both township and Township, landfills capacity and their life span, landfill liners (Figure 4.1-44), waste transportation, landfill gases and management system and leachate generation and management system.

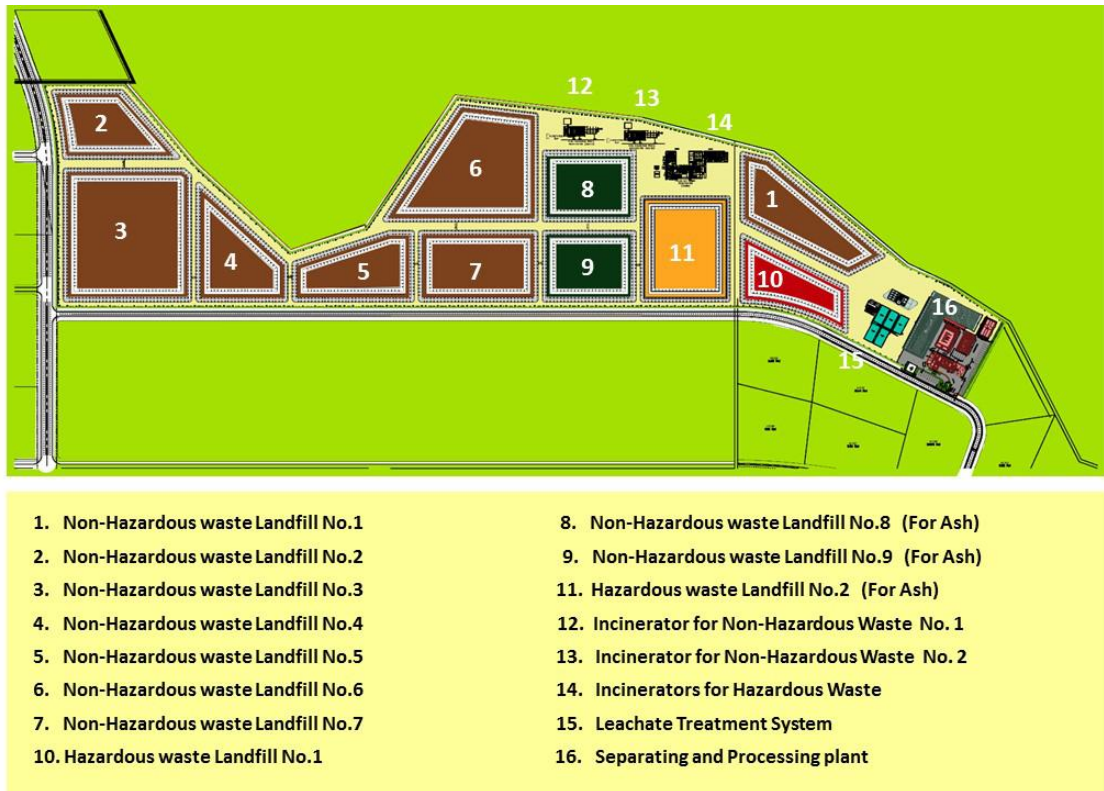

Figure 4.1-43 Layout of facilities in Solid Waste Management System located in the Township

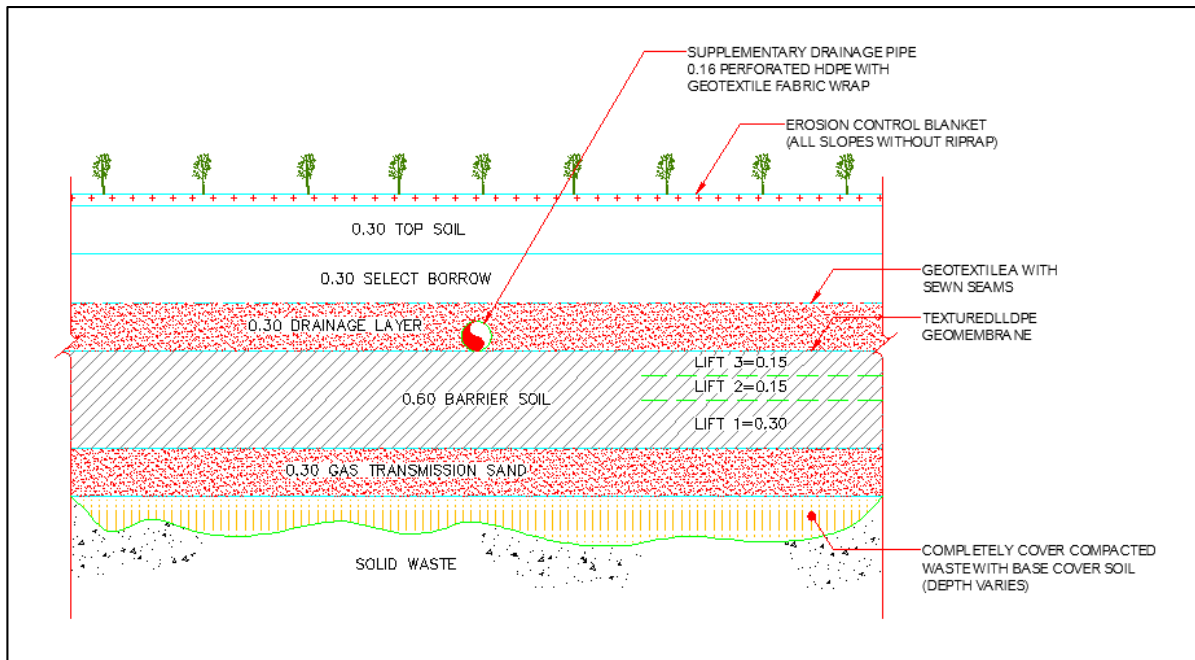

Figure 4.1-44 Final cover for non-hazardous waste and hazardous waste landfills

For example: the hazardous waste will be stabilized and finally disposed in the hazardous waste landfills during the initial phase. For the later phases, the non-hazardous and hazardous waste will be disposed in the incinerators accordingly to their types. Rate of non-hazardous waste generation from the Initial Township is presented in Table 4.1-9 is shown rate of non-hazardous waste generation from the township in 50 years and Table 4.1-10 is shown rate of hazardous waste generation from township in 50 years.

Infectious waste generated from hospital and health care facility in the Initial Township supposes to managed and dispose within the township by incinerator; however, upon demand of health care service, the infectious waste will be disposed at the Dawei hospital or alternatively in Yangon dumping sites, initially. Transportation of the infectious waste will require manifest as regular. Rate of infectious waste generation from the township is shown in Table 4.1-11. Air emission guideline for hospitalized incinerator is presented in Table 3.4-3.

Table 4.1-10 Rate of Non-Hazardous Waste Generation for the Township (for 50 years)

year	Population (Person)	Waste Generate (1kg/person/d)	Waste		Non-Hz 97% By Weight (T/d)	Operation (day)	Total Industrial Waste (T/A)	Ash 10% by weight (waste)		Cumulative Non-Hz Waste (T)
			(kg/day)	(T/d)				Bottom ash 80% by weight (T/A)	Fly ash 20% by weight (T/A)

#### 4.1.9 Fire Prevention System

The Project has designed fire prevention system in accord with Myanmar laws and regulation (in *Section 3.2.3.4 (f)* and Annex 4-4), Thai Building Control Act, 1979 and NFPA standard. The Fire Prevention System for the apartments including 5-floor workforce apartments and 8-floor service apartments constitutes of components as follow

- Fire Alarm System
- Lightning Protection System
- Fire Fighting System
- Assembly points

##### 4.1.9.1 Fire Alarm System

Fire Alarm System constitutes of 7 components; Alarm Control Panel, Graphic Annunciator, Fire Alarm Manual Station, Fire Phone Jack, Fire Alarm Speaker with Strobe Light, Fixed Temperature Heat Detector and Smoke Detector. Their description and installation are summarized in Table 4.1-12.

**Table 4.1-13 Fire Alarm System**

<b>Fire Alarm System</b>	<b>Details</b>
1. Fire Alarm Control Panel (FCP)	Detect and receive signal from fire detector devices or sub-panel and send signal to fire alarm system, electricity system and emergency light system.
2. Graphic Annunciator (ANN)	Detect and receive signal from fire detector devices or sub-panel and define location of fire incident.
3. Fire Alarm Manual Station (F)	Manual alarm switch by pulling and inserting key (W/Key Operated Switch)
5. Fire Alarm Bell (B)	Send sound and light warnings to residents. Alarm Bell shall be a Fire Alarm Speaker with Strobe Light or Conventional Alarm Bell, which shall be 6 inches in diameter at least and loud enough, not less than 85 dB(A).

Source: EIA Study Team

#### **4.1.9.2 Lighting Arrester System**

The system is convention that consists of lighting arrester rod, conductor, downward conductor and ground pike lung. The downward conductor is made of copper and charges distributor for electrical constant. The Project will install Lighting Arrester System and ground spike system on ground floor of each buildings and lightning rod on roof of each building.

#### **4.1.9.3 Fire Fighting System**

The Project has planned to establish Fire Fighting System (FFS) that enables to cope with fire incidents and emergency for a level. The Project has itself FFS such as installation of FFS for each residential buildings and supporting firefighting facilities from nearby towns in case severe fire.

##### ***(a) Residential Buildings Fire Fighting System***

Fire Fighting System constitutes such as Standing Pipe System, Fire Hose Cabinet, Fire Department Connection, Fire Extinguisher, Fire Exit, Fire Escape Sign and Emergency Light and Fire Escape Route Map and Extinguisher Location. Their description and installation are summarized in Table 4.1-13.

**Table 4.1-14 Residential Buildings Fire Fighting System**

<b>Fire Prevention System</b>	<b>Details</b>
1. Stanpipe	Supply water to Fire Hose Cabinet. The pipe is about 4 inches and connects to Fire Department Connection on ground floor in front of each building. Alternatively, in case Emergency, the pipes shall be able to connect with water supply tank on roof of each building.
2. Fire Hose Cabinet (FHC)	Standard Fire Hose Cabinet consists of handy fire extinguisher and hose reel. Hose reel must be at least 1 inch in diameter and 30 meter in length and made of textile. Hose reel consists of aluminum alloy nozzle and auto jet/fog/spray.

**Table 4.1-14 Residential Buildings Fire Fighting System**

Fire Prevention System	Details
3. Fire Department Connection (FDC)	Connection point for supply water to Fire Trucks in order to supplement fire water protection. The FDC must be instantaneous screw inlet that is 2 ½ inches (65 cm.) in diameter.
4. Fire Extinguisher	Type ABC (10 pounds / 4.5 kg.) Chemical Fire Extinguisher-Handy type, with blue panel. Type CO <sub>2</sub> (10 pounds / 4.5 kg.) Fire Extinguisher-Handy type, with black panel (See <b>Annex 4-4</b> )
5. Fire Exit	Main stairs inside of the apartments are used as Fire Exits. The stairs have to be more than 1.2 meters with slope less than 45 degree and have stair platforms. Wall of the stairs have to be fire resistant and made of reinforce concrete wall.
6. Fire Escape Sign Luminary and Emergency Light	One-way or Two-way luminous and visible signs must be provided including emergency light for 2 hours. The signs shall be prescribed in both English and Myanmar languages. Characters size in the signs must not be less than 10 cm.
7. Fire Escape Route Map and Fire Extinguisher Location	Inform about fire escape route map that lead the residents out of buildings through fire exits and location of fire extinguishers.

**(b) Township Fire Station**

The Project has a plan to establish the fire station, which will be a share facility between the Initial Industrial Estate and the Project. Also, the Project plans to form reserve fire brigade team in accordance with the said law that is not only to operate and manage the fire station / fire work, but also to co-ordinate with the Fire Service Department and relevant agencies in preparation for fire incidents i.e standardized fire apparatus (See Annex 4-4: Guideline of Fire Training and Equipment) and training program for involving brigades and staff and residents.

Location of the Fire Station will be in public facility of the initial township, as shown in Figure 4.1-45. Illustration of the Fire Station is shown in Figure 4.1-46. The fire station is planned to equip with fire apparatus and features following:

- Hydraulic platform for rescuing in the elevated levels;
- Major pumpers from water sources;
- Special pumpers consisting of fire extinguishing agents such as foam, chemicals;
- Water tanks for transporting large volume of water;
- Foam tanks ;
- High-pressure hoses;
- Rescue equipment
- Fire trucks

Number of fire trucks, pumper trucks, fire equipment are planned to develop in concordance with phases of the Township and number of population growth in the initial township (Table 4.1-14). These amounts of the Project's resource is evaluated to be sufficient in controlling Tier 1 level of emergency (Controllable case with in the plant or the factory) and Tier 2 level of emergency (Controllable within the Township). However if a severe emergency occurs (Tier 3 level), which is unable to control by the Project resource and potentially extend and impact beyond the Project area (See *Section 4.1.10.1*), the Project will need support from local facilities or agencies, such as Fire Station and Fire Brigade team from the nearest town such as Yebyu Fire station.

**Table 4.1-15 Expected Number of Fire Station Supporting Vehicles**

Year	Phase	Fire Truck (No.)	Pumper Truck (No.)
2016 -2017	A	1	1
2018 -2019	B	1	-
2019-2021	C	1	-
2022-2023	D	1	4
<b>Total</b>		<b>4</b>	<b>5</b>

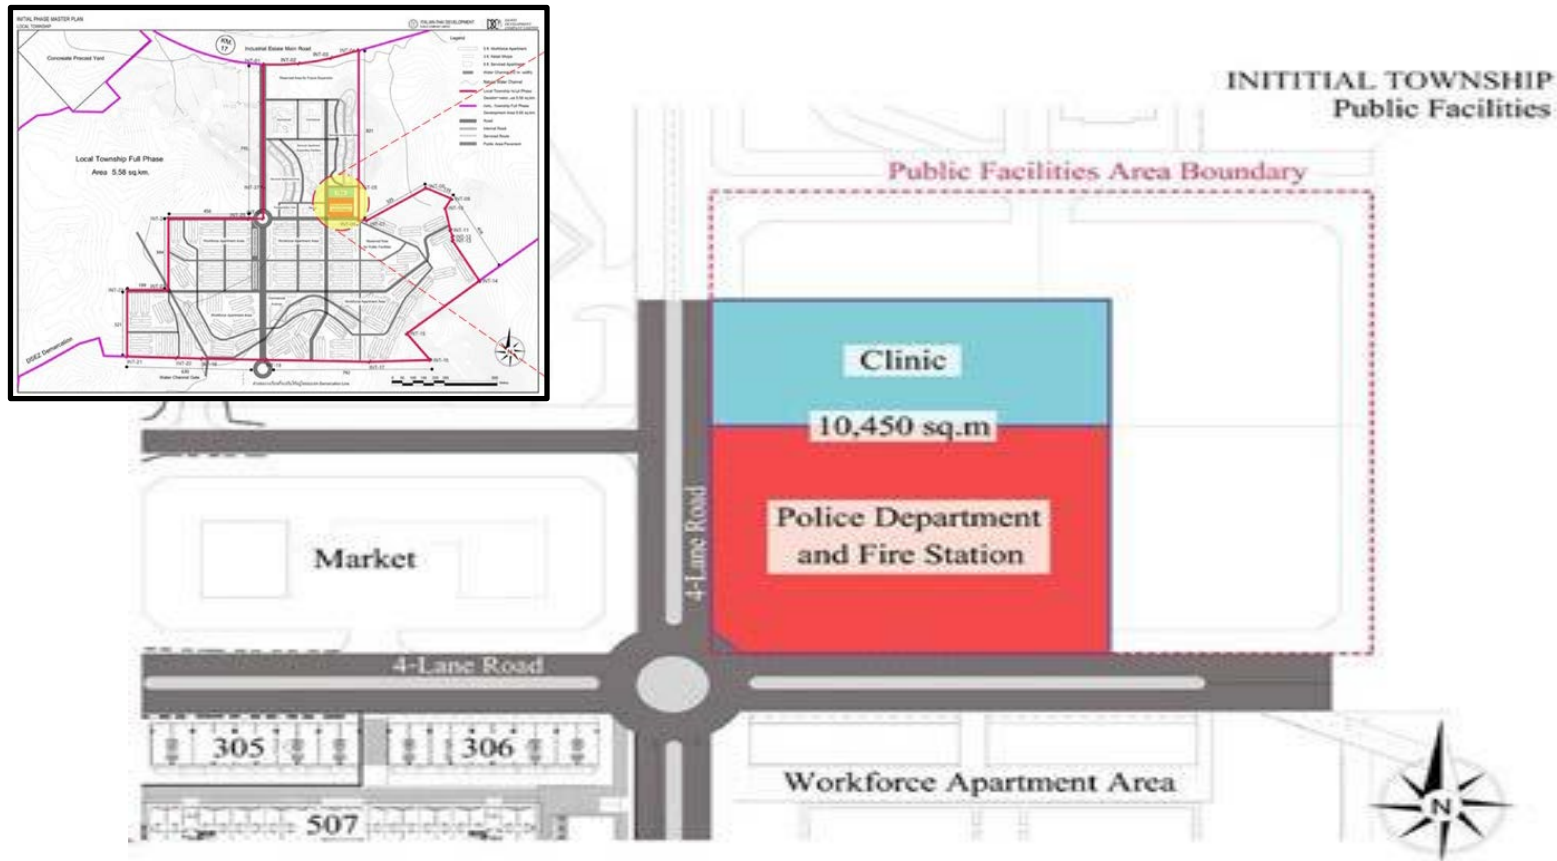

Figure 4.1-45 Location of the Fire Station (Share facility) in the Initial Township

Figure 4.1-46 Illustration of Fire Station

### **(c) Supporting Fire Stations**

Yebyu Fire Station is located in the Yebyu Township, approximately 6 km from the Project (Figure 4.1-47). It is linked with the Township by good roads. The Yebyu Fire Station consists of medium fire brigade team (7 fireman) on shift 7/24 and 4 Fire trucks, 1 Fire tank truck, 1 Fire tank tractor, as show in Figure 4.1-48 to Figure 4.1-51. The Fire tanks can supply 30 liters per second and the tank trucks contains approximately 4,000 liters and the tank tractors contains 1,000 liters.

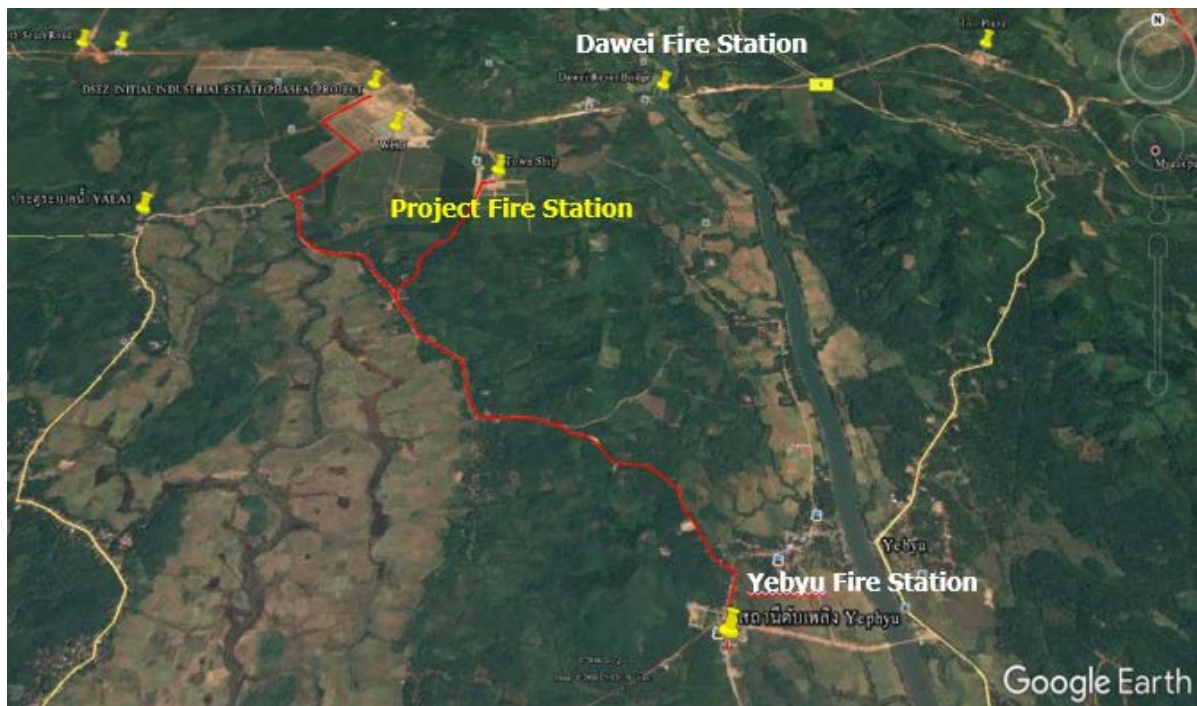

Figure 4.1-47 Location of Yebyu Fire Station from the Project Facility

#### **4.1.9.4 Assembly Points**

The Project will provide enough assembly points to check number of residents before remove them out of the Township to safety areas. Ratio of the assembly point area must not be less than 0.25 sq. meter.

Figure 4.1-48 Yebyu Fire Station and facility in Yebyu Township

Figure 4.1-49 Yebyu Fire Trucks (No.1 and No.2)

Figure 4.1-50 Yebyu Fire Trucks (No.3 and No.4)

Figure 4.1-51 Yebyu Fire Tank Truck and Fire Tank Tractor (No5 and No.6)

#### 4.1.10 Emergency Response Plans

As enacted in the Fire Brigade Law 2015, Fire station, Fire brigades and the Emergency Response System are needed for safety and security of people and properties in case of natural disasters, epidemics and fire. To prevent and minimize damages that may incur in many cases including recovery and remedy, Emergency Response Plans are required as part of EIA.

##### 4.1.10.1 Emergency Levels and Action Plans

###### (a) *Emergency Level*

Emergency response plan of the Dawei Township can be categorized into 3 levels

- *Tier 1 level* is a small scale of emergency that will occur in room/building and potentially limited within the room of resident or building. The incident can be controlled by the Project facilities in each building, as prescribed in *Section 4.1.9.1* and *Section 4.1.9.3*.
- *Tier 2 level* is a medium scale of emergency that is likely to extend to the other apartment or outside of the cause building. The building trends to be unable to cope with itself and may need supporting facility. However, the level of emergency trends to be controllable by facility of the Township and restricted within Township.
- *Tier 3 level* is a large-scale of emergency that likely to extend to the nearby community and environment surrounding the Township. The emergency trends to cause large scale of impact, which will be beyond control of the Township. This level will certainly need supporting facilities and cooperation from outside the Township or nearby districts/provinces or agencies.

###### (b) *Emergency Action Plan*

For each level of emergency, the action plans are following:

###### Tier 1 Emergency Action Plan

###### *Responsibility of Resident/Shop*

- In case emergency, it is responsibility of resident/shop in capable and controlling fire incident or emergency as much as possible to mitigate damages that may incur to properties or the other people.
- The Resident/Shop must activate warning system e.g. turn on the fire alarm or alarm bell to warn the other residents.
- The incident shall be initially reported to the Dawei Township Management Team (Each building staff or security) or Dawei Township Emergency Response Center as soon as possible.

### *Responsibility of the Project*

- The incident shall be reported to Emergency Response Center or the Township Reserve Brigade team within 10 minutes.
- Once, the Dawei Township Emergency Response Center received emergency information. The Dawei ER center shall record and immediately inform the on-site shift ER staff or manager to investigate the incident, follow up and monitor environmental impacts including be prepared or stand by to inform the other related emergency agencies, outside the Project.
- The on-site ER manager has to evaluate the situation/incident and be prepared to coordinate with the emergency supporting team. Also, the on-site ER manager must keep reporting to the Dawei Township Emergency Commander/ Director (Dawei TS-EC/ED).
- In case the incident is severe and potentially extend. The Dawei TS Emergency Commander/Director must evaluate environmental impacts. Also to coordinate and communicate related people for further next step.

### Tier 2 Emergency Action Plan

#### *Responsibility of Resident/Shop*

- The Resident/Shop must activate warning system e.g. turn on the fire alarm or alarm bell to warn the other residents.
- If the residents/shop evaluates that the incident / emergency is unable to control, they must evacuate off the building to assembly point or safety area as soon as possible.
- The residents/shop, who cause the incident, must be with or coordinate with or join Fire Brigade Team of the Dawei Township Emergency Center, in order to provide useful information for the fire incident.

#### *Responsibility of the Project*

- After receiving report, the ER Center must follow steps as mentioned in Tier 1.
- If the Dawei TS-EC/ED evaluates that the impacts is intensify, beyond the capability and control of the Township facilities, he/she will announce the Tier 2 Emergency Level. At this stage, he/she must be on duty to manage the incident/emergency with his/her best effort, effective command, facilitate and support in controlling the incident/emergency.
- Dawei TS-EC/ED must directly report to Dawei Township Director or Executive or the Person In Charge.

### Tier 3 Emergency Action Plan

#### *Responsibility of Residents/Shop*

- The same actions as in Tier 2

#### *Responsibility of the Project*

- After receiving report from residents/shop, the ER Center must follow steps as mentioned in Tier 2
- The Onsite ER manager must analyze and evaluate environmental impacts that may incur the Township itself and nearby community. Also he/she must keep reporting the Dawei TS EC/ED.
- Once the Dawei TS EC/ED evaluate that the impact is seriously intensify and extending to local or nearby community, he/she will announce Tier 3 Emergency level and he/she must be on duty to manage the incident/emergency with his/her best effort, effective command, facilitate and support in controlling the incident/emergency.

In addition, to coordinate with the local community leader, township or district administrators/agencies to obtain supports and to consider about announcement of the emergence in the district or provincial level.

- Dawei TS-EC/ED must directly report to Dawei Township Director or Executive or the Person In Charge.
- Dawei TS-EC/ED must go to the Dawei Emergency Center to control the Township emergency, in order to to conduct and cooperate and providing information to related agencies such as Township/District/ Provincial Administrative.

Flow charts of the Dawei Township Emergency Procedure is presented in Figure 4.1-52 and flow chart of the Dawei Township Emergency Responsibility is presented in Figure 4.1-53.

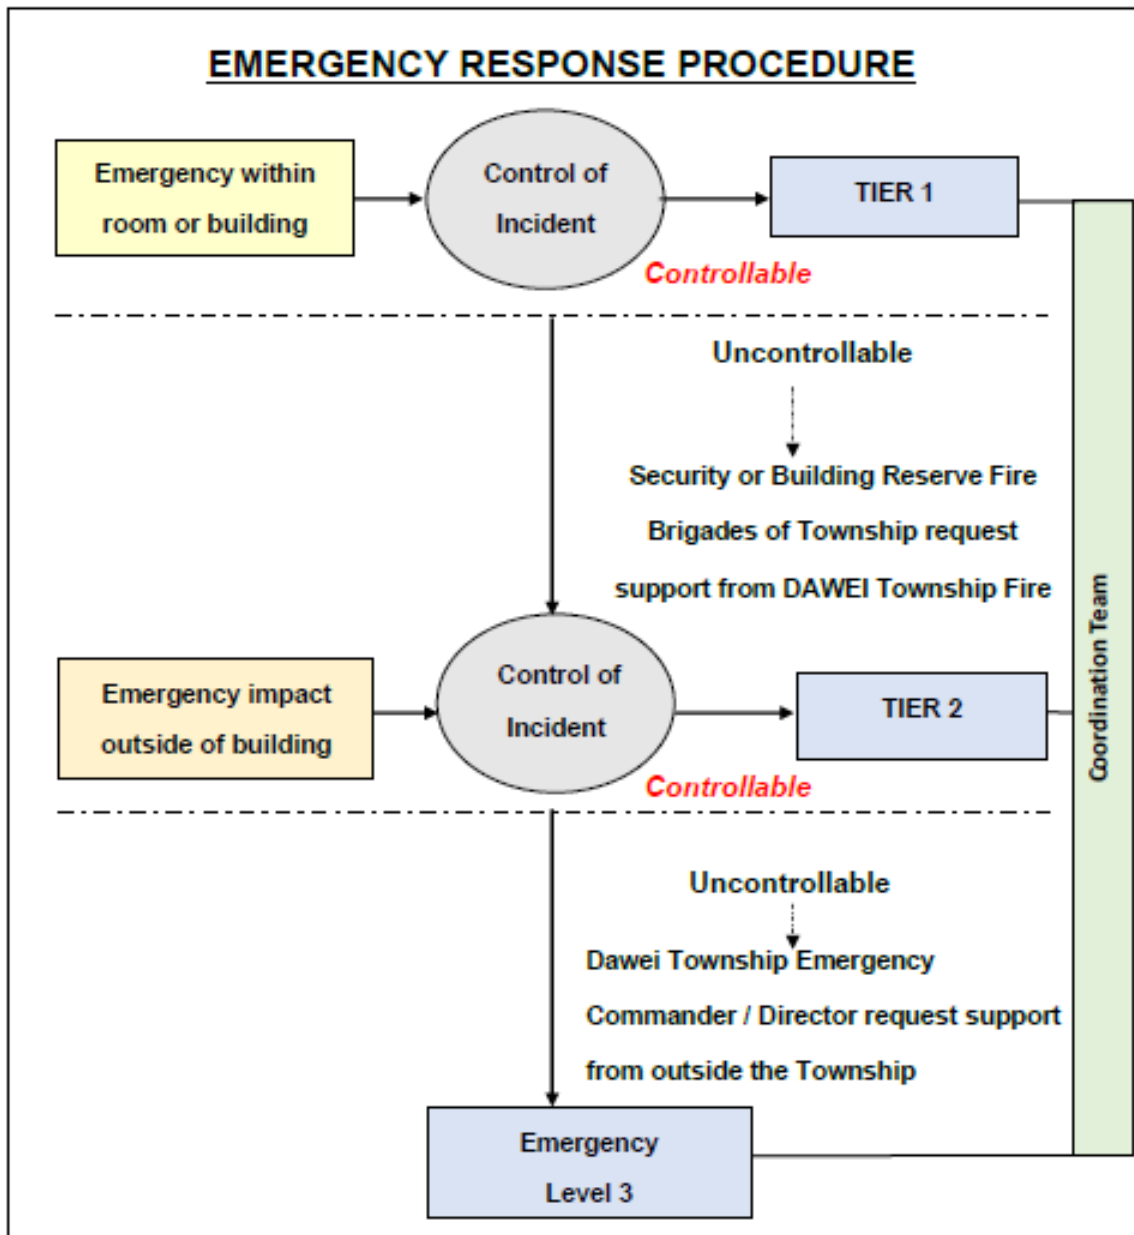

Figure 4.1-52 Flow chart of Emergency Response Procedure

**RESPONSIBILITY FLOW CHART**

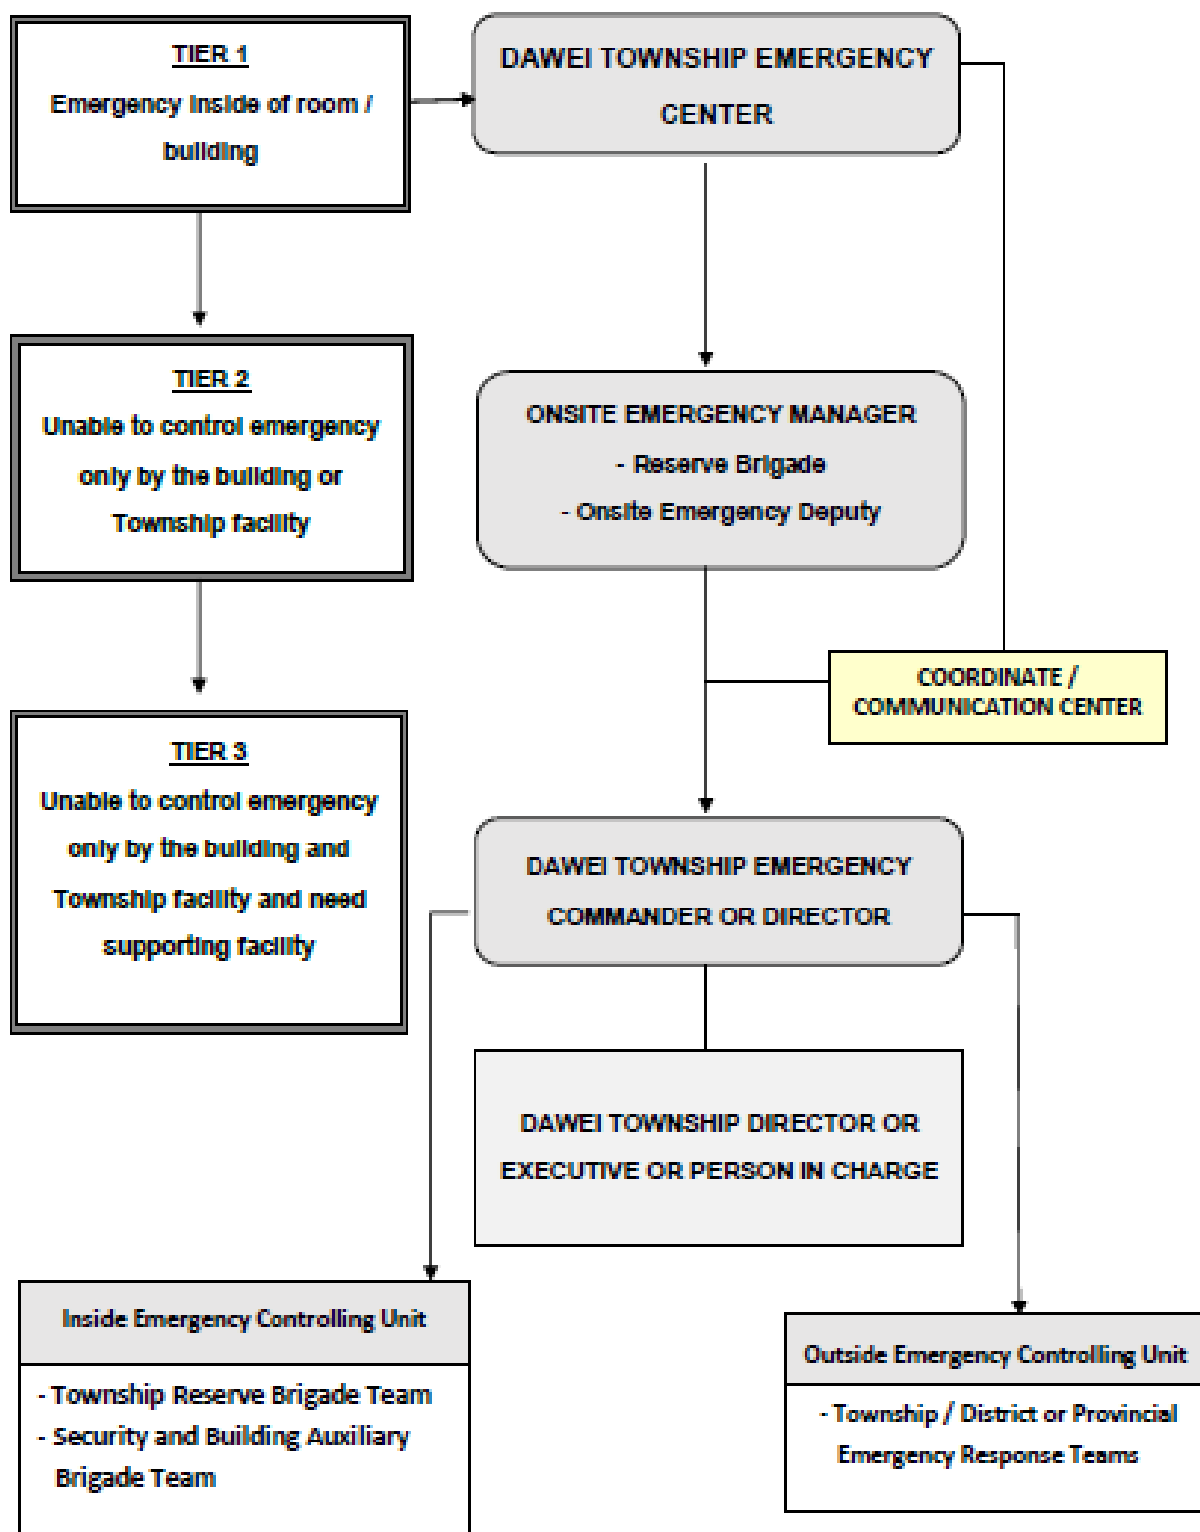

Figure 4.1-53 Emergency Response Responsibility

#### 4.1.10.2 Fire Emergency Response Plan

##### ❖ Construction Phase

Fire can cause by fuels and chemicals that are used during construction or from some construction activities e.g. welding or electrical instruments / equipment. The Project will

- Implement safety plan to sub-contractor including emergency and evacuation plan during construction.
- Manage electricity supply by experienced and skilled electricians.
- Store construction materials in safety or appropriate containers or places, especially flammable materials or fuels.
- Implement OHSA, brief or train construction workers.
- Have head of construction or duty manager to control the work.
- No smoking in working area.
- No over load of uses of electricity.
- Always check equipment or instrument are ready to use.
- Welding must be done at least 35 feet from flammable or fuels.
- Prepare enough fire extinguisher or apparatus.
- Provide 24 hrs security staff for safety and emergency.

##### ❖ Operation Phase

###### **(a) *Preparation and prevention plan***

- Prepare reserve or secondary water source for fire extinguishing
- Prepare at least 1 fire truck
- Prepare different type of fire extinguishers/apparatus in many spots in the building.
- Install fire alarm for emergency including testing the fire alarm and emergency plan in workplace.
- Annual check and inspection of fire apparatus are always ready to work
- Annual Fire Campaign especially in hot and dry season
- Inform and communicate through residents and people by effective channels
- Annual rehearsal fire emergency response plan
- Cooperate supporting agencies outside the Township e.g. Township/District Fire Brigade team.

### **(b) Fire Fighting and Evacuation Plan**

The fire fighting and evacuation plans are classified into 3 levels.

#### Level 1 Fire Emergency Plan: small fire within room or building

- Fire watcher or witness shall turn on fire alarm to warn the other residents.
- Fire watcher or witness shall request help to fire off by using the existing fire apparatus or fire extinguisher.
- The witness or security or building fire reserve brigade shall evaluates fire incident. If the fire is uncontrollable, he/she needs to announce "Evacuation"
- Proceed the evacuation in safety area or the assembly point, check missing persons and cut off the electricity.
- If the fire incident potentially extends or uncontrollable, the apartment manager/security/On-site Fire Emergency staff have to inform the Dawei Township Emergency Response Team.
- Report to Onsite Dawei TS-Emergency Manager and Dawei TS Emergency Commander / Director, respectively.
- Coordinate with the other apartment's manager or administrator in order to control or manage situation in the Township by many effective channels.

#### Level 2 Fire Emergency Plan: medium fire potentially extend outside the apartment

- Once, Dawei TS-Emergency Commander /Director announces Level 2 Emergency. Every residents in the apartment or related teams or persons must follow the Tier 2 Fire Emergency Plan in order to control or stop the fire incident as much as possible.
- If the fire is controllable, separate the incident site from the other area for inspection and investigation of causes and damages and report to the Dawei IE-Emergency Commander/Director to waive the Tier 2 Fire Emergency
- If the fire is uncontrollable, and trends to be extended and impacts nearby apartment and/or local community, the Dawei Emergency Center must obtain support from the local emergency agencies e.g Township/District Fire Service and brigades team.
- The Onsite Emergency manager must report to the Dawei IE-Emergency Commander/Director
- Coordinate and inform residents, the other apartment's manager or administrator in the Township by many effective channels.

Level 3 Fire Emergency Plan: severe fire potential extend outside the Township

- Once, Dawei TS-Emergency Commander /Director announces Level 3 Emergency. Every residents and related teams or persons must follow the Tier 3 Fire Emergency Plan in order to control or stop the fire incident as much as possible.
- The Onsite Emergency Fire manager must report to the Dawei TS-Emergency Commander/Director, Executive/Director of the Dawei Township/Person In Charge and the director of Myanmar Housing.
- Coordinate and inform residents, the other apartment's manager or administrator in the Township by many effective channels.

*Role and Responsibility of the Emergency Response Center and Team*

- Dawei Township Emergency Commander / Director
- Emergency Coordination Team
- Dawei Emergency Center
- Communication and coordination Team
- Support and Evacuation Team
- Utility Team

*Inspection*

Room or building that causes the fire must be inspected by the expert from relevant agency and will be committed a fraud and penalty by the Township.

**(c) Recovery Plan**

After fire disaster, the Dawei Township has to coordinate with the supporting agencies both government or private to remediate and recovery from the damages as soon as possible:

- Provide support for medical treatment and provide temporary accommodation and sanitary for victims that have to be evacuated from the fire site, see Cooperate Social and Responsibility (CSR) in Section 9.9.4.
- Remove victims and their belongs to safety area
- Remediate and support victims who cannot support their life
- Control the areas in security and safety manners.
- Check that if any victims needs or require support.
- Inform victims and people about cause of fire, prevention plan in the future and recovery plan.
- Resident or room or shop who causes a fire must commit the fraud, penalty and compensation according to the laws.

### Fire Emergency Response Plan

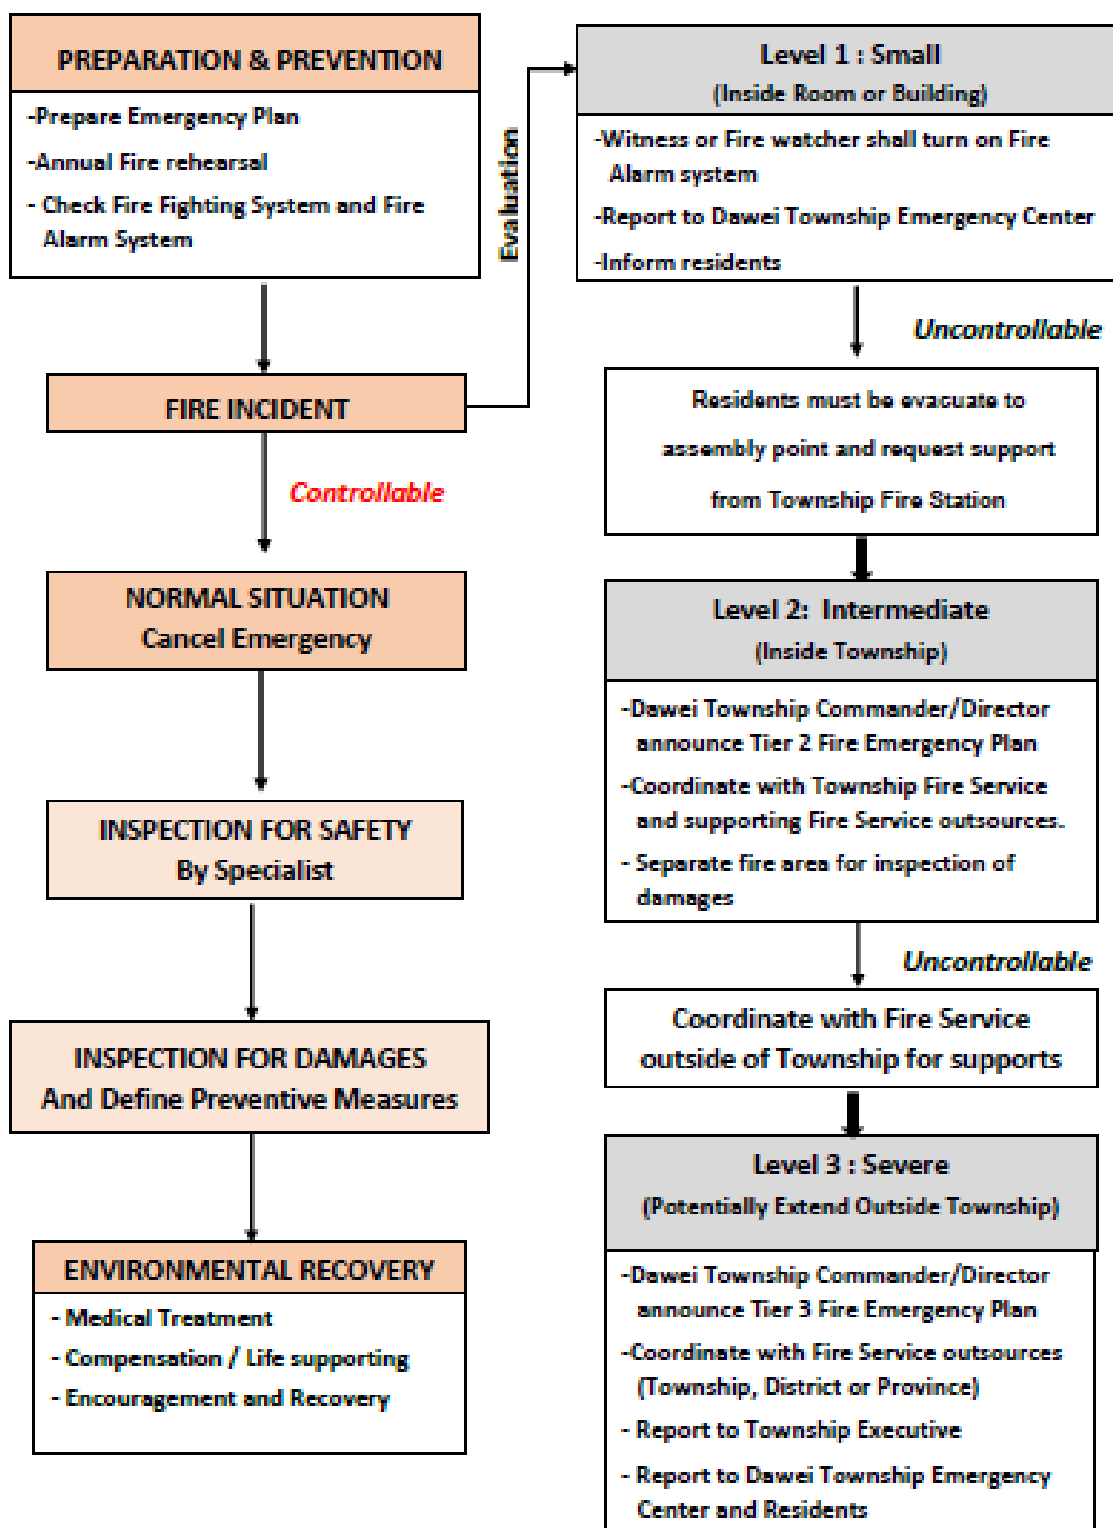

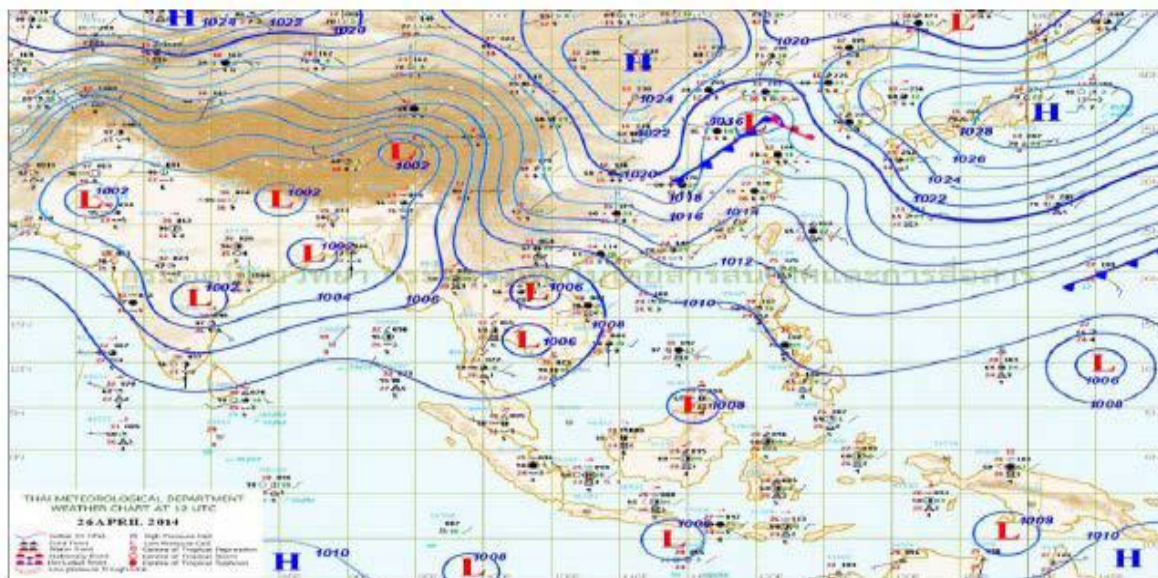

Figure 4.1-54 Emergency Response Procedure for Fire and Explosion

### 4.1.10.3 Storm and Flooding Emergency Response Plan

The Project has designed Flood Controlling System (FCS) (see *Section 4.1.4*) due to the Project is located near Dawei River and Kun Chuang River. The Project will be able to manage flood for a level; however, in case of natural disaster e.g. extra-ordinary heavy rains or cyclone or typhoon that may impact to the Township. Thus, the Storm and Flooding Emergency Response Plan and Procedure (Figure 4.1-57) is required and it consists of

#### (a) *Preparation and prevention plan*

- Checking drainage / cannels or creeks in the Township
- Dredging drainage and cannels
- Keep low level in drainage / cannels or creeks
- Monitor level of water in drainage / cannels or creeks
- Inspect and maintenance retention ponds
- Checking and maintenance pumps and equipment
- Prepare sand bags, back holes, mobile pumps including vehicles and communicable equipment for emergency case
- Be aware and follow up weather condition or forecast (Figure 4.1-55) and flooding announcements from relevant government agencies such as Metrological Department

[http://www.tmd.go.th/weather\\_map.php](http://www.tmd.go.th/weather_map.php)

Figure 4.1-55 Weather forecast and meteorological condition

- Analysis of satellite images / maps about flooding hazard

[http://www.tmd.go.th/weather\\_map.php](http://www.tmd.go.th/weather_map.php)

**Figure 4.1-56 Satellite images - Flooding**

- Follow up levels of water in Kun Chuang River and Dawei River including intrusion of salt water stage, route and condition and draining of these rivers.
- Follow up and check risk spots, salute gates or drainage of the Township
- Establish “*WAR Room*” to co-ordinate, prevent and solve the flooding problem in the Township for 24 hrs. Director of the Dawei Township will be commander and co-ordinate with the other agencies.

**(b) *Warning and Evacuation Plan***

Four levels of emergency and evacuation plan

Level 1 : Follow up and stand by

- Evaluate the situation and follow up
- Survey and check readiness of prevention plan
- Emergency commander / related director must be on duty
- Co-operate with the Township Emergency Response Team
- Inform the residents for situation

Level 2: Move belongs / objects to prevent damages

- Emergency commander announces and commands the plan
- Conduct and follow the plan and coordinate with the other agencies.
- Report and evaluate the situation to the emergency commander in controlling the emergency
- Communicate and inform residents in the other apartments by channels.

Level 3: Evacuation preparation

- Emergency commander announces emergency plan
- Conduct and follow the plan and coordinate with the other agencies
- Evaluate and report to emergency commander
- Communicate and inform residents in Township by many channels.

Level 4: Evacuation

- Announcement and command the plan
- Follow the prevention plan and evacuation plan
- Evacuate to provided location or safety area
- Provide vehicles; car, truck and facility for evacuation
- Report and evaluate situation to emergency commander
- Coordinate and inform relevant agencies by channels.

Evacuation team consists of emergency commander, emergency coordinator, flood controlling unit, emergency communicator, safety and traffic and evacuation team.

**(c) Recovery plan**

After flooding events, the Project has prepare the recovery plan as follow:

- Inspection of the flooding area by expert for safety and damages
- Storage and collect waste by flooding
- Renovation and fix damages such as road, facilities, painting, planting and construction of retention ponds.

### FLOOD RESPONSE PROCEDURE

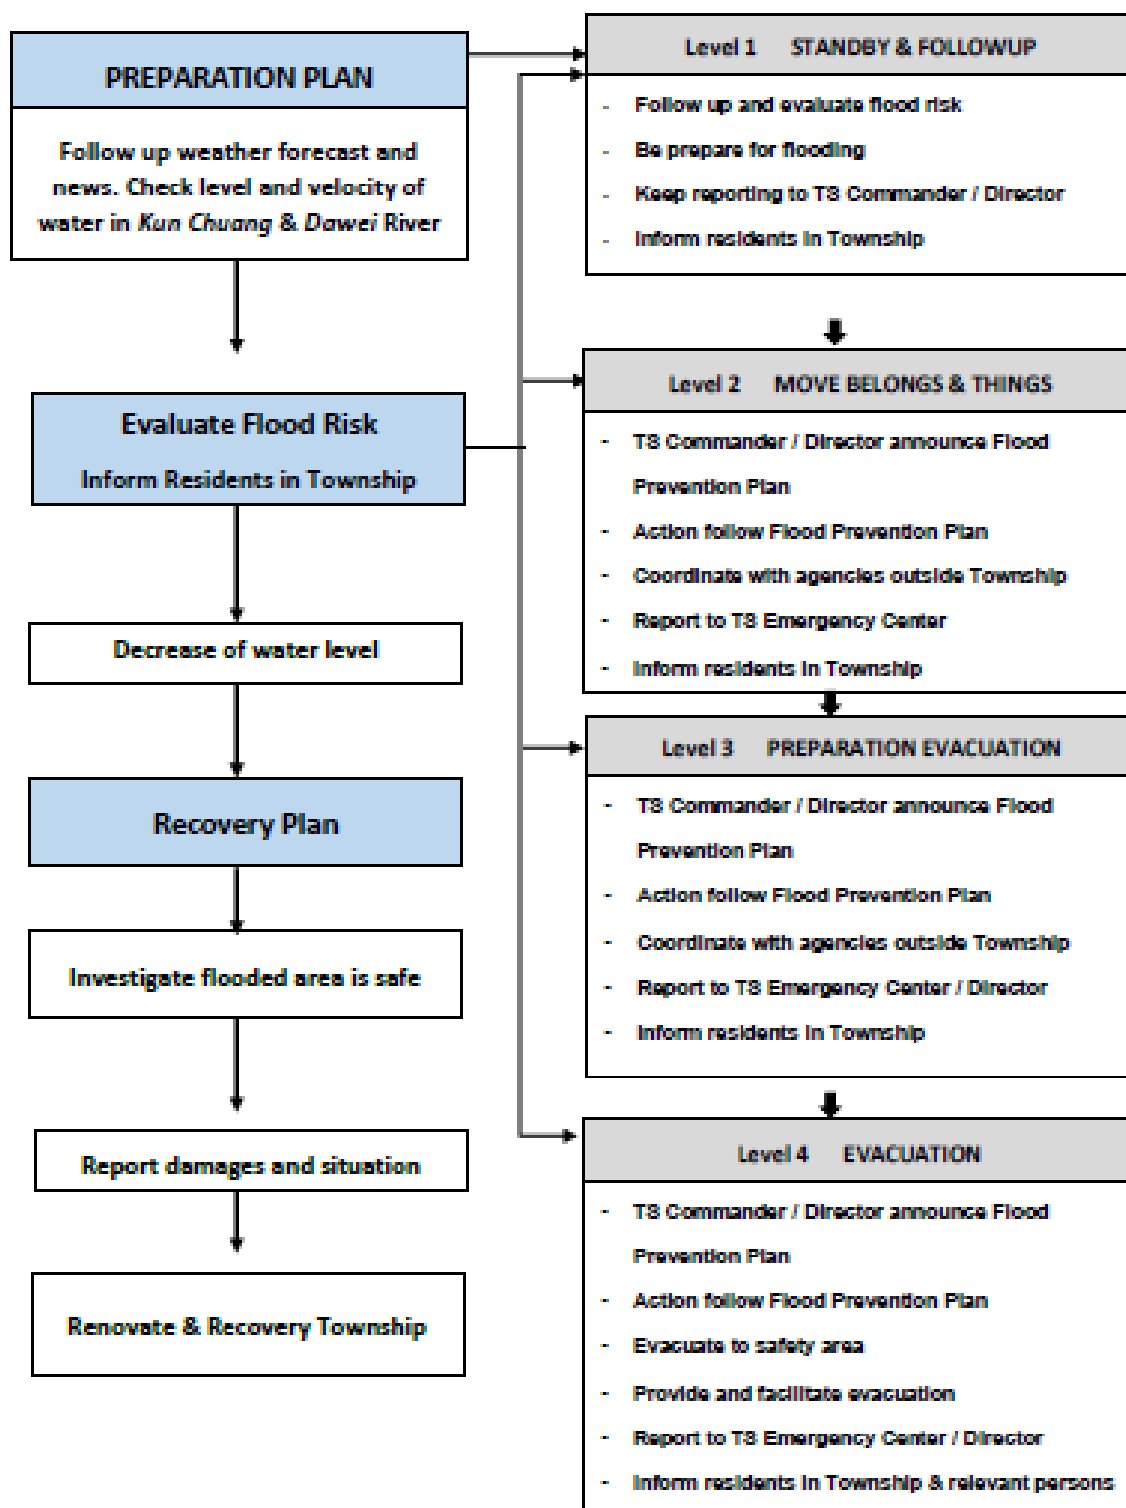

Figure 4.1-57 Flow chart of Storm and Flooding Procedure in Emergency

## **4.2 PROJECT ACTIVITIES**

### **4.2.1 Construction Phase**

#### **4.2.1.1 Construction of Infrastructure**

Preparation of the Initial Township area and infrastructure involves large quantity of earth moving and clearing of existing vegetation in the area. All the existing vegetation in the township area, except those within the green areas, will be cleared.

Construction of utility systems and infrastructure is another major activity for the development of Initial Township. The construction will include necessary earthwork, concrete work, commissioning, and procurement of necessary equipment and machines for the following infrastructure and utility systems.

- Main road, secondary road, and tertiary road networks;
- Flood protection and drainage system;
- Wastewater collection and treatment system;
- Firefighting and emergency response system; and
- Construction of Initial Township

Further descriptions of the above infrastructure and utility systems are discussed in Section 3.5.

#### **4.2.1.2 Construction Work Camp and Workshop**

A main construction work camp (Figure 4.2-1 to Figure 4.2-3), which is used for accommodation of workers involved in the construction of Initial Township, is located at KM18 south of the main road. The accommodation is expected to support a maximum of 371 workers employed by Italian-Thai Development PLC., the main construction contractor of Initial Township.

In addition, area of 256,000 square meters is also used for facilities supporting the construction activities including concrete batching plants, mechanic workshop, warehouse, precast and reinforced concrete yard, and site office.

In order to respond massive demand for housing, the construction process must be completed in short time while quality and cost control must be complied. Thus, some precast raw materials, which are steel, cement and architectural materials (doors and windows), will be transported from Thailand by barges and trucks. The other construction raw materials e.g. sand and graded rocks will be supplied from local quarry in vicinity of the DSEZ. The following are the benefits of using precast system.

- Better quality control
- Shorter period of construction
- Less sound pollution and air pollution

- Lower material loss ratio

ITD has already started setting up for precast yard since 2013 in order to ensure on-time construction of Initial Township project.

**Figure 4.2-1 Batching Plant and Cement Tower Setting up at Precast Yard Area at KM. 16.5**

**Figure 4.2-2 Precast Construction Equipment**

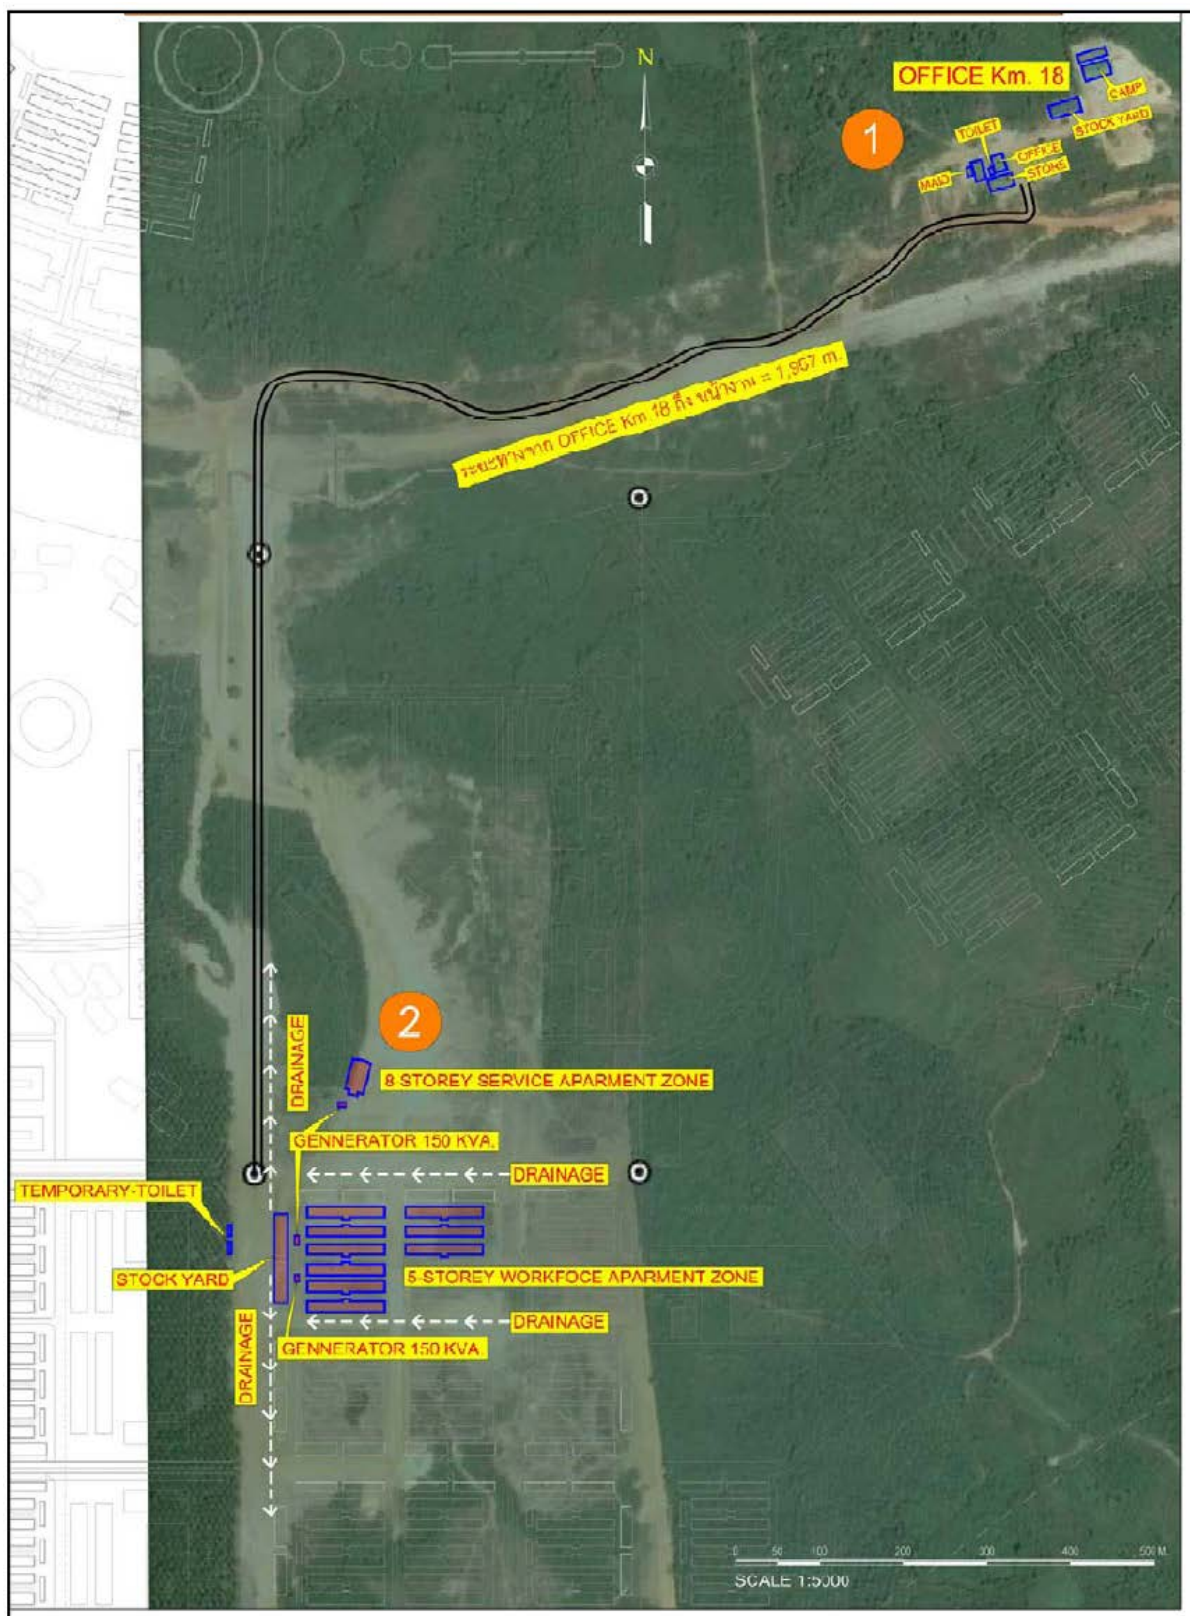

Figure 4.2-3 Layout of Main Construction Camp, Workshop and Yards

#### 4.2.1.3 Transportation of Construction Materials

Construction materials will be supplied from Thailand and will be transported by through Myanmar-Thailand border at Kanchanaburi Province. The Main Road inside the township area will be improved and widened to accommodate the transportation of materials and machineries, which will be done mainly by dump trucks and trailers.

During construction period, the roads will likely be shared between the local communities and the construction activities. Improvement of the road including installation of traffic signs, improvement of line of sights and curvatures, and road widening will be conducted. Road sections that pass through existing villages will be water sprayed to reduce dust that is resulted from the transportation. With progressive resettlement of the existing villages in the industrial estate area and construction of permanent secondary roads, it is expected that traffic conditions in due to transportation of construction materials will be improved over time.

#### 4.2.1.4 Sanitation of Campsite

Workers camp shall be constructed in accordance with Standard of the Engineering Institute of Thailand. Sanitary management for worker camp shall be in accordance with Standard and Layout for Temporary Construction Worker Camp issued by the Engineering Institute of Thailand Under H.M. the King's Patronage (Wor Sor Tor. 1010-34 Standard). Worker camp shall be constructed sufficiently for number of workers. Materials used for worker camp construction refers to Local Temporary Building Regulation, and electrical cable and device refer to Metropolitan Electricity Authority Standard. The following obligations shall be written in the contractor contract. Construction shall be in accordance with sanitary practices as described following:

##### (a) Location

- Worker camp shall be 100 m away from waterway to prevent sedimentation and contamination
- Worker camp shall be surrounded with 2 m high fence.

##### (b) Design

- Room area at least 3.0 sq. meter per person. Width or length inside of each room shall not be lower than 2.4 x 2.4 m. Height from ground to lowest top-wall shall not be lower than 3.0 m. At least one set of door and window shall be equipped, including at least 1 lamp and 1 electrical plug in the room.
- Shared bathing room and washing room shall be provided by contractor in ratio of 7.0 sq. m per 20 persons. Water tank and water tap shall be sufficiently provided for bathing and washing, including sufficient light.
- Toilet shall be sufficiently provided by contractor in ratio of 1 toilet room per 20 persons. Area of toilet shall not be less than 0.90 sq. m and internal width is not less than 0.90 m. Lamp and light also shall be sufficiently provided. Toilet shall be at least 30 m away from natural waterway.
- Worker camp shall be surrounded with fence with only one gate for access control. Security guard shall be provided with guard house at gate.

- At least one set of fire extinguisher shall be provided per building or in every 45.0 m. Fire extinguishers are specific purposes as presented in Table 4.2-1.

**Table 4.2-1 Type and purposes of Fire Extinguishers in Worker Camps**

No.	Areas	Type	Number (Set)
1	Store	Halotron, 5kg	1
2	Welding shop	Halotron, 5kg	1
3	Laydown	Halotron, 5kg	4
4	Guard house	Dry Chemical ABC, 5 kg	1
5	Canteen	Dry Chemical ABC, 5 kg	1

- Shared cooking area shall be sufficiently provided by contractor. It should be away from worker camp or around 2-3 m to prevent firing from cooking. Area to put on cooking stove (gas/wood), cooking space, washing sink, drainage ditch, garbage bins and lids shall be sufficiently provided.

#### **4.2.2 Operation Phase**

Operation of the Project will be by phases as described in *Section 4.1.1.4*. Activities during operation phases are following

##### **4.2.2.1 Residential Activities**

As the Project will develop by phase, many activities related to living and playing in Township residential area will begin in small area of zone 9 plus 1 including public and green area within this zone. Afterwards, the residential activities will expand up to size of population that will move in to reside in the Township by phases; A, B, C and D, respectively.

##### **4.2.2.2 Commercial Activities**

Commercial activities may start when some retail shops start operating their businesses. This is including establishment and operation of the commercial venue in commercial area that will start when suitable time arrive.

##### **4.2.2.3 Traffic and Transportation**

Major transportation during operation will relate to routine travelling from residents' accommodation to their workplace e.g. the Initial Industrial Estate, plants and factories in DSEZ etc. Transportation of residents may be via private motor vehicles e.g. cars and motorcycles. Alternatively, public cars or buses may operate between Township and some spots in DSEZ including inside the Township and the Township and nearby towns.

Once commercial in Township expands, transportation of goods will start. Initially, traffic may not too congest due to design of road network system are still enough for loads of vehicles. However, due to construction of the other zone of Township will be developed in parallel of the operation, transportation of construction materials and equipment will share in some routes in Township.

#### **4.2.2.4 Flood Protection Management**

The Project has designed Flood Protection System that can prevent the Project from flooding approximately for 6 hours (See details in Section 4.1.4). Rain water will be collected through drainages and canals underneath the Township. Operation of the system consisting of pumps and salute gates to hold and drain flooded water into Dawei River for the northern retention pond and into Kun Chung River for the southeast retention ponds.

#### **4.2.2.5 Solid Waste Management**

As the population in the beginning phase is still small; thus, small volume of waste will be generated. The waste will be managed accordingly procedure described in *Section 4.1.8.1* by the Initial Township staff and facilities. The non-hazardous waste will be collected, stored, delivered and disposed at the nearest disposal site and standard facility in Dawei. Hazardous waste and infectious waste will be stored in 200 drums or appropriate containers and will be transported to Yangon for suitable disposal at this stage.

Once the Waste Management System of Dawei Initial Industrial Estate starts operating, the waste will be disposed in these facilities according to procedure prescribed in *Section 4.1.8* and Annex 4-2.

#### **4.2.2.6 Wastewater Management**

Wastewater is preliminary treated by Onsite Treatment Units, which are installed in every buildings before draining to the Project wastewater treatment facility, resting ponds. The ponds will be operated when BOD of wastewater is excess 20 mg/L, over the effluent standard by NEQG (see *Section 4.1.7*). Pumps shall always be ready on duty and spare pumps shall be prepared for emergency and maintenance. Wastewater from northern resting ponds will be discharged into the Dawei River and wastewater from southern resting ponds will be discharged into the Kun Chuang River.

#### **4.2.2.7 Fire Prevention and Emergency**

The Project will have an annual rehearsal of Fire Evacuation and Emergency for residents and related staff. This is an active safety, practicing activity for fire and emergency cases according to procedure prescribed in *Section 4.1.10*, Fire and Emergency Prevention Plan, which includes prevention, roles and responsibility of each parties and persons during the incidents, recovery and inspection.

#### **4.2.2.8 Employment**

The Project will start employ local staff e.g. electricians, plumbers, gardeners and cleaners etc. for buildings and green areas management and operation and maintenance of the Township. Employment standard will follow the prescribed law and regulation in *Section 3.2.3.3* of the said laws and standard of Occupational Health and Safety Administration in Annex 4-3.

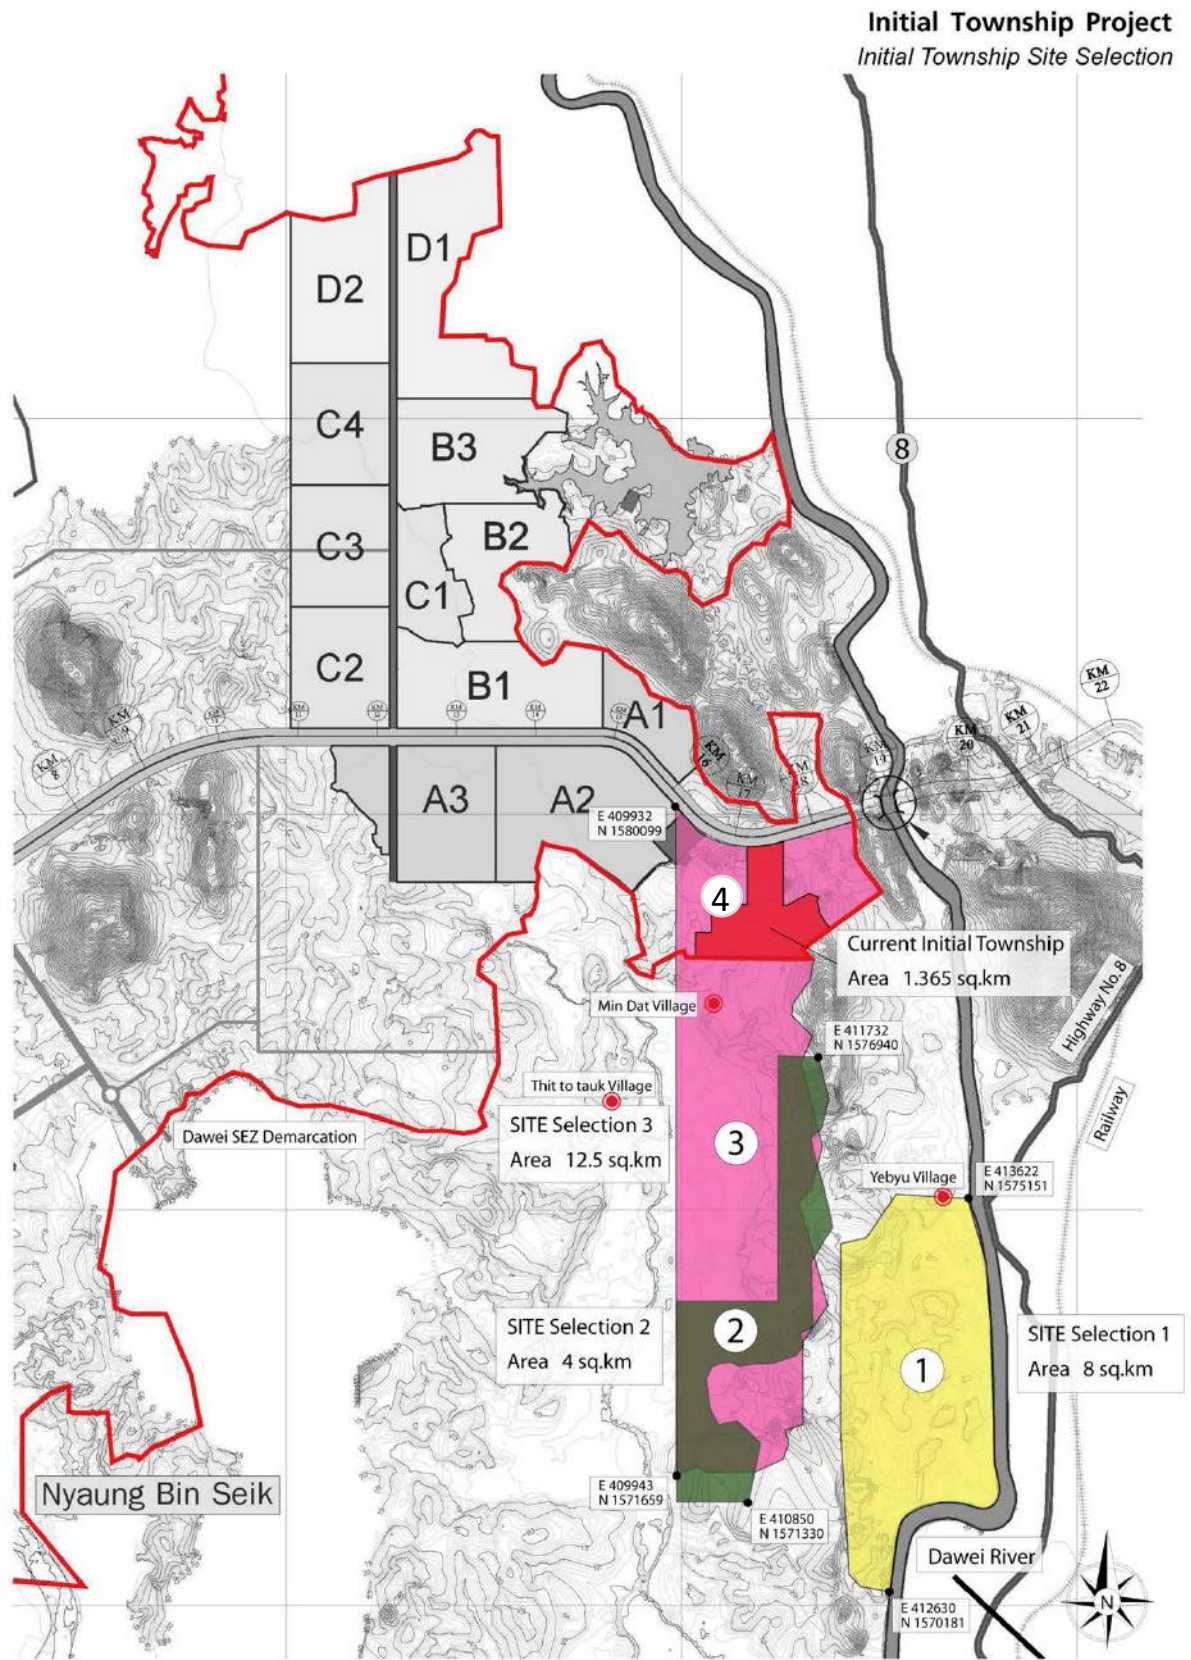

## 4.3 PROJECT ALTERNATIVES

This section described the important alternatives to the project that have been evaluated in the associated feasibility studies. Key alternatives that have been considered in the previous studies include:

### 4.3.1 Project Site Selection

Four alternative sites were considered. The locations of the four sites are shown in Figure 4.3-1. Details of each site, summarized from the feasibility study, can be described as follow:

- **Site No.1:** The total area is 8 square kilometers located on the east side of medium and light industrial zone with potential to become a nice riverside town. This area is flat and has two mountain as buffer from the heavy industrial and the Dawei River can be developed for both transportation and recreation purpose. However, there are three existing villages in the township zone i.e. Yebyu, Kyuak Htuak and Sin Pu Nit Villages. The interview from villagers living in Yebyu Village said that the flood came up 10 meters from the Dawei River Edge. Furthermore, there are mountains on the west side which located temples and monarchies. According to not closer with the main road, this site will be upgraded access road.
- **Site No.2:** The total area is 4 square kilometers located on the east side of medium and light industrial zone. This area has two mountain as buffer from the heavy industrial and the Dawei River can be developed for both transportation and recreation purpose. However, there are mountains on the east side which located temples and monarchies. According to not closer with the main road, this site will be also upgraded access road.
- **Site No.3:** The total area is 12.5 square kilometers Local township area boundary; the north is connected with medium industrial zone, the east is connected with 3 mountains (KaNyin Gauk, Tha Pye Zun and Ga Nan Taung) having monastery on top at each mountain, the west is connected with the light industrial zone and the south is at the demarcation line of Dawei Industrial Estate. However, there is the Min Dat Village existing in the township zone.

Source: DRC (2015)

**Figure 4.3-1 Site Selection Alternatives**

- **Site No.4:** The total area is 5.58 square kilometers while the initial township covers an area of 1.365 square kilometers. Local township area boundary; the north is connected with the main road of the industrial estate, the east is near the high terrain and the Dawei River along the eastern boundary of DSEZ, the west is connected with the light industrial zone and the south is connected with an agricultural plain area. This site consumes less area to support the Dawei Industrial Estate and fewer disturbances to nearby sensitive areas. And according to the shape of project area, the Initial Township grid system has been designed into fan-shaped grids with multiple town accesses which will prevent traffic congestion at one access. And the location of project area is also closed with the main road of the industrial estate; it can approach the township easier.

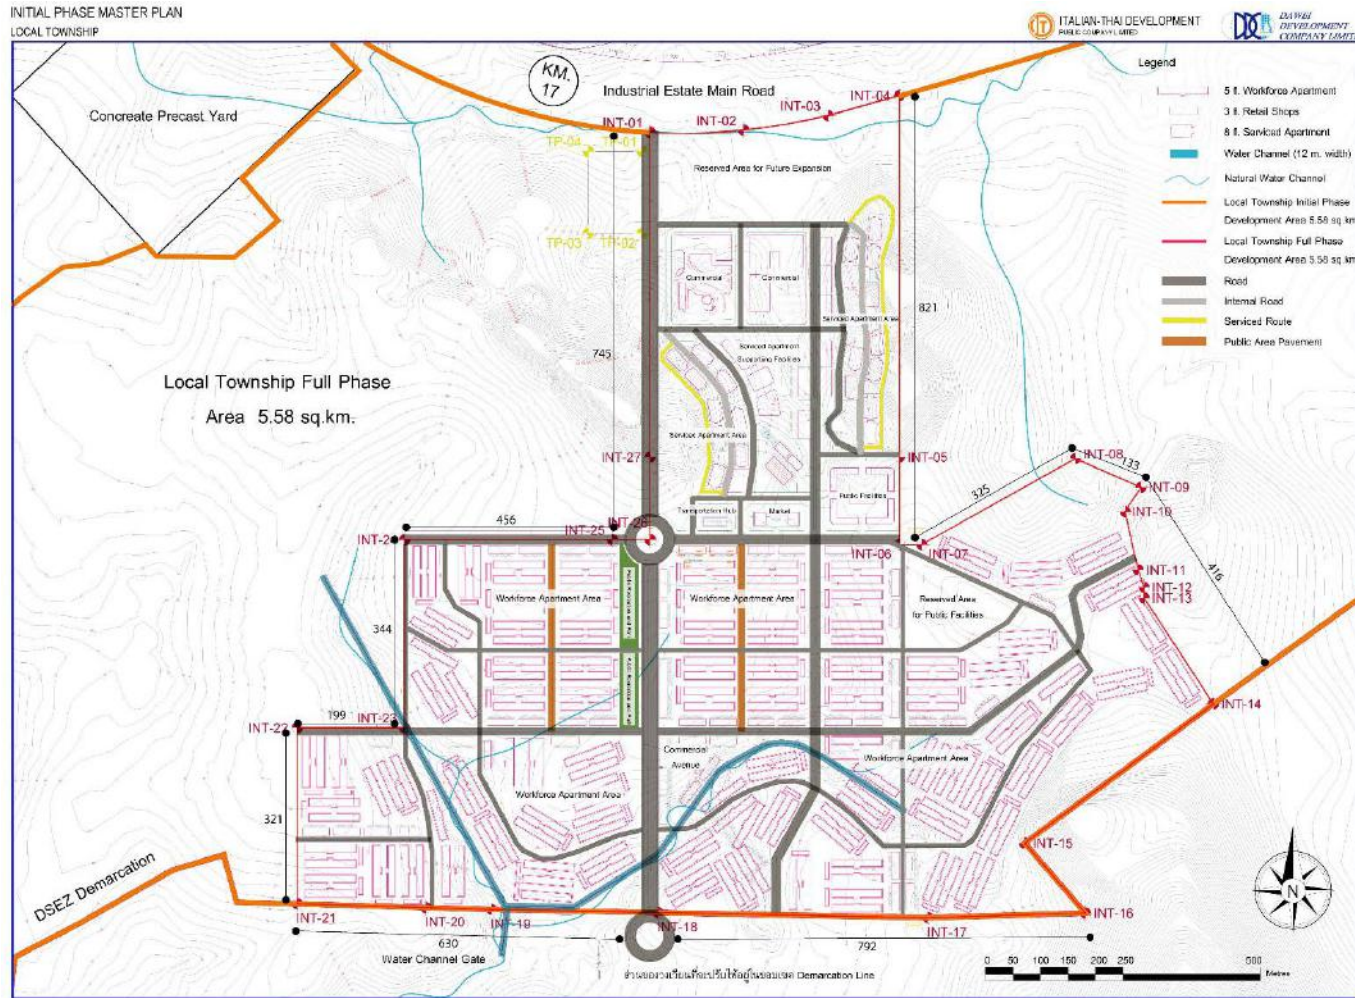

The following evaluation main criteria are used in considering the appropriate site location (DRC, 2015):

- The site should have no impact on nearby villages both economic and social sides;
- Preliminary, land ownership of the site will be preferred the government;
- The site should be at plain area to be convenience for development and water discharge;
- The site should have good access to the main roads for transportation in terms of distance and road alignment, both vertical and horizontal.

Considering all of the above criteria, Site No.4 was selected as the most appropriate site for the construction of township.

#### **4.3.2 Project Master Plan**

Upon selection (Site No.4) of the appropriate size master plan for the township (Figure 4.3-2), the estimated project area in final phase is 5.58 square kilometers and 1.365 square kilometers in initial phase. The township is divided into 7 areas namely: commercial/ retail shop, 5- floor workforce apartment, 8- floor serviced apartment, recreation/sport, green area, road/traffic route and initial facilities as presented in Table 4.3-1.

a) Updated Project Layout and Master Plan

Source: ITD (2015)

Figure 4.3-2 Project Layout and Master Plan Alternatives

ITD revised master plan to further develop the concept of the project with further details on infrastructure and utility design. Major components that are developed during the master plan preparation include (ITD, 2012):

- Relocation of township area closer to the entrance of the area to make it more convenient to access,
- Increase the size of the green area,
- Conceptual layout of township, and
- Conceptual design of infrastructure and utility systems.

**Table 4.3-1 Summary of Area in Master Plan for the Initial Township**

Description	Updated Master Plan Area	
	(m <sup>2</sup> )	(km <sup>2</sup> )
Commercial / Retail Shop	47,234 sq.m	0.047 sq.km
5-floor Workforce Apartment	284,175 sq.m	0.284 sq.km
8-floor Serviced Apartment	67,500 sq.m	0.068 sq.km
3-floor Retail Shops	103,275 sq.m	0.103 sq.km
Recreation / Sport	36,354 sq.m	0.036 sq.km
Green Area	557,121 sq.m	0.557 sq.km
Road / Traffic Route	222,885 sq.m	0.223 sq.km
Initial Facilities	46,546 sq.m	0.047 sq.km
<b>Total</b>	<b>1,365,000 sq.m</b>	<b>1.365 sq.km</b>

Source: DRC (2015)

The alternative in the revised master plan was the one selected for the assessment of potential impact in this EIA report.

#### **4.3.3 Comparison and selection of the project alternatives**

Criteria for site selection such as area, location and accessibility, topography and landform, social, culture and economics and construction cost is summarized in Table 4.3-2.

Considering by area and shape, alternative 2 and 4 are smaller in size than alternative 1 and 3. Alternative 4 has the most preferred shape, in fan-shaped, while the others are almost rectangular

Considering by location and accessibility, alternative 4 is located in the best position which is easily to access by the main road of Dawei SEZ and is the nearest alternative to the Township and its utilities.

Considering by topography and landform, all alternatives except alternative 1 are in quite elevated area whereas, alternative 1 is just next to the Dawei River that area along the river in alternative 1 is potentially flooded. However, alternative 1 will so gain benefit from river recreation and alternative 1, 2 and 3 will so gain visual benefit from hilly terrain.

Considering by social, culture and economics, alternative 1, 2 and 3 will have severe impacts from traffic congestion because there have such long accessed roads from the Township before diverting to Main road and later then in the Township. Next, many villages will be relocated, if alternative 1 and 4 are selected.

Considering by construction cost, alternative 4 is the most economical because of its location in nearby the Township and good access to main road. Flat topography with less slopes will reduce cost for construction of water drainage supply and discharge system; whereas, the other alternatives are in hilly terrain and with slops and the extra-long access roads need to be constructed.

## CHAPTER 5 DESCRIPTION OF THE ENVIRONMENT

### 5.1 SETTING AND STUDY LIMITS

In the Environmental Impact Assessment (EIA) study, it is necessary to establish baseline information on the environment and socio-economic settings of an area which could receive and indirectly impacts from the Project construction and operation. The baseline information serves two purposes. Firstly, it is used in conjunction with the information on the project for identification of potential impacts of the Project and assessment of their significance. Secondly, it serves as the benchmark for evaluating environmental and social management performance of the Project construction and operation.

For the purpose of establishing baseline information on the environmental, the study limits are to consist of geographical limit and contextual to guide the baseline information collection.

#### 5.1.1 Geographical Study Limit

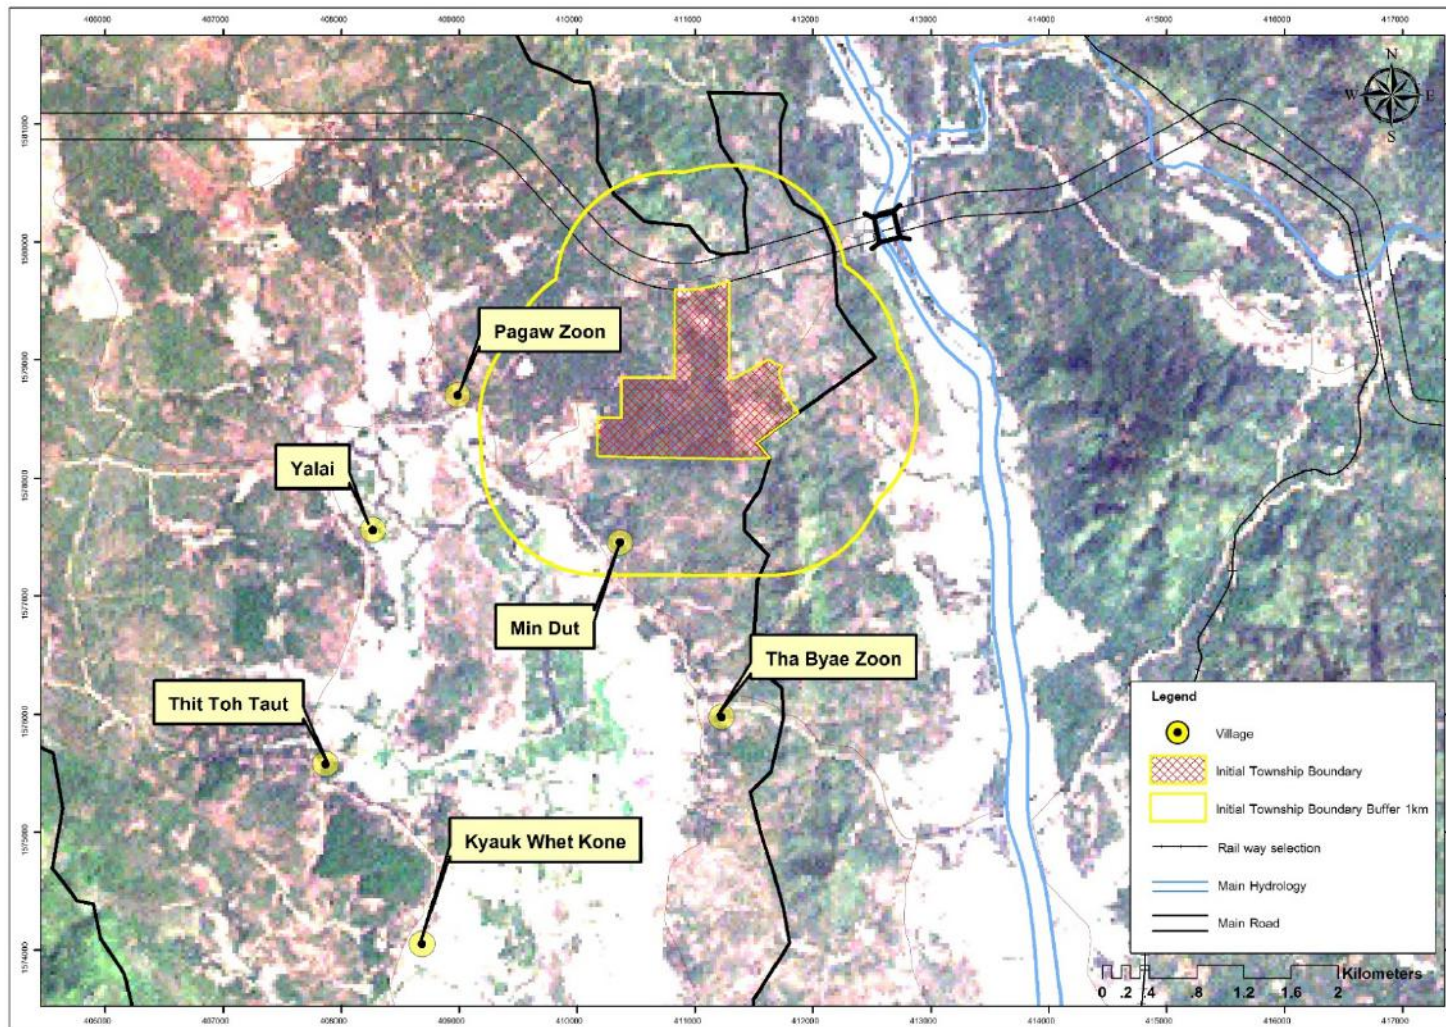

The geographical study limits is defined as an area surrounding the project site from which the baseline information collection should be collected. In this study, the geographical study limit is about 5 km extending from the center of the project site. This geographical study limit covers 78.57 km<sup>2</sup> of circular area around the project site as shown in a map in Figure 5.1-1. This area is referred to in subsequent sections of this report as “the study area” The study area should cover sensitive receptors of environmental impacts of the Project during project construction and operations.

#### 5.1.2 Contextual Study Limit

The EIA guideline defines the contextual study limit to consist of four groups of components: (i) physical components; (ii) biological components; (iii) socio-economic components; (iv) cultural components. Considering the nature of this Project and its potential environmental issues, the composition of each main component is presented below:

##### (1) Physical components

- Topography and soils
- Geology and seismology
- Hydrology
- Climate and air quality
- Noise and vibration
- Groundwater Quality
- Surface Water and Sediment

Source: SEATEC, 2012b

Figure 5.1-1 The geographical study limits

(2) Biological components

- Surface water biology and fisheries activities
- Forestry
- Wildlife

(3) Socio-economics components

- Initial township development
- Health profile
- Infrastructure facilities
- Traffic and transportation
- Land use

(4) Cultural components

- Historical and archeological sites

## **5.2 PHYSICAL COMPONENTS**

### **5.2.1 Topography and Soil**

#### **5.2.1.1 Study Area**

The proposed project activities comprised of land leveling, excavation, and others may cause alteration to the topographic condition. Initial Township Project is bounded by Dawei River in the East and the Andaman Sea in the West. The study area will be divided into two levels including topography of Dawei city and topography within Initial Township Project.

#### **5.2.1.2 Baseline Topography and Soil Conditions**

Topography and soil conditions Information from the following relevant environmental studies were reviewed:

- Final Report for consultancy services for the Main Road, Flood Control, Infrastructure & Utilities, Task 2 Industrial Estate Flood Control & Drainage Study and Conceptual Design (SEATEC, 2012b).
- Topographical Map of Tavoy Burma 1:250,000 Series U542, Sheet ND 47-6, Edition 1-AMS, 1957 (USACE, 1957).
- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Final Report of Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013).
- Environmental Impact Assessment (EIA) for Main (SEATEC, 2012c).

- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012).

The following sections are summarised the information from the above documents.

### Topography

Terrain Regions in Myanmar are divided into 5 zones which are: 1) Central Myanmar; 2) Western Mountains and Arakan Coast; 3) Northern Myanmar; 4) Shan Highlands; and 5) Tenasserim. Dawei is classified into Tenasserim or Burmese Tanintharyi, which refers to the narrow coastal region in Southeastern Myanmar, bordered to the East by Thailand and to the West by the Andaman Sea (Figure 5.2-1).

Dawei is a city in Southeastern Myanmar, situated about 614.3 km (381.7 miles) South of Yangon on the Northern bank of the Dawei River.

The general topographic condition of Dawei River Basin is characterized by a plain alternating with hills in the valley with high mountains surrounding the area. There are a number of natural streams flowing from mountains to the central of the area, forming the main river, Dawei. The Dawei River flows through the project site which situates in Myanmar, close to Kanchanaburi Province of Thailand (Figure 5.2-2).

The project area is comprised almost entirely of flat plains. There are four rivers running from the North to the South of the project area. The four rivers are: Nabule River; Dawei River; Kunchaung River; and Pan Din In Chaung River (Figure 5.2-3).

### Soil

There are nine soil types in Myanmar (Figure 5.2-4) Major soil types of the project area are occupied by the Saline Swampy Meadow Gley (GL-Gleysol). These soils occur in the Ayeyarwady Delta, along the river bands of the Gulf of Motama, and the marine flat lowlands influenced by the tidal sea water; which is always salty. Due to high salinity and constant tidal sea water, the land can only be utilized for prawn breeding and mangrove firewood forests. The adjacent soil type of GL-Gleysol is Light Forest Soils (Cinnamon), or NT-Nitisol. These soils mostly occur on the very gently sloping alluvial-deluvial under the mountainous plains of the Dry zone area and are also found on the lowest parts of the Shan Plateau. The physical properties of these soils are very favorable and, in spite of being sandy, they are pervious and not heavy in which to work. The soils are generally fertile, which is related to their position in the mountainous plains. There is a constant supply of nutrients from the surrounding mountains because of the surface run-off. These soils are suitable for the cultivation of Yard crops (dry cropping on uplands).

## **5.2.2 Geology and Seismology**

### **5.2.2.1 Study Area**

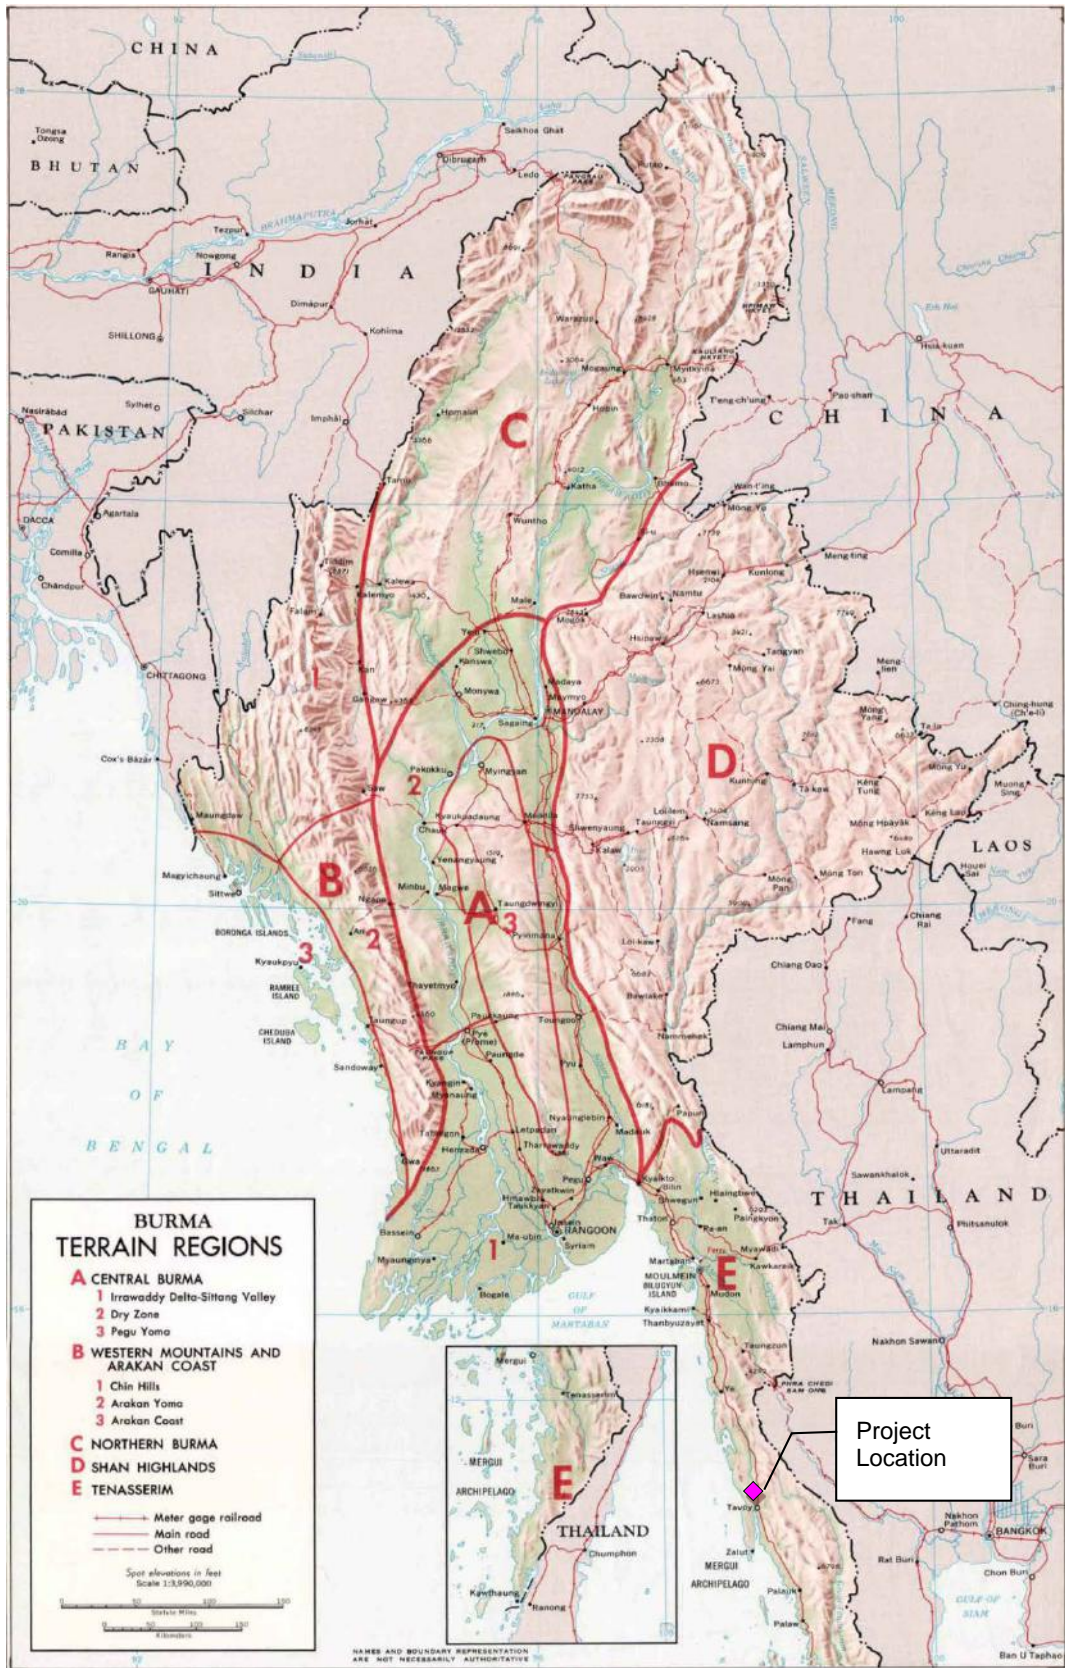

Geological information can be used to indicate potentials of earthquakes and mapping of any potential mineral deposit. Seismology has been a serious concern for construction design because of its potential to cause threats to the project. The geological map of the project area and the area within a 5 km. radius of the project boundary will be considered while the seismologic study will provide the seismic record of the country.

### **Baseline Geological Conditions**

Information on geological conditions of Myanmar is rather limited and most of the information available on public domains is on regional level. The following documents are reviewed in this section:

- Geological Map of the Socialist Republic of the Union of Burma (USACE, 1977).
- Burma Rock Types (USACE, 1990)
- Regional Geology of Myanmar (Pramumijoyo et al., 2010)
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

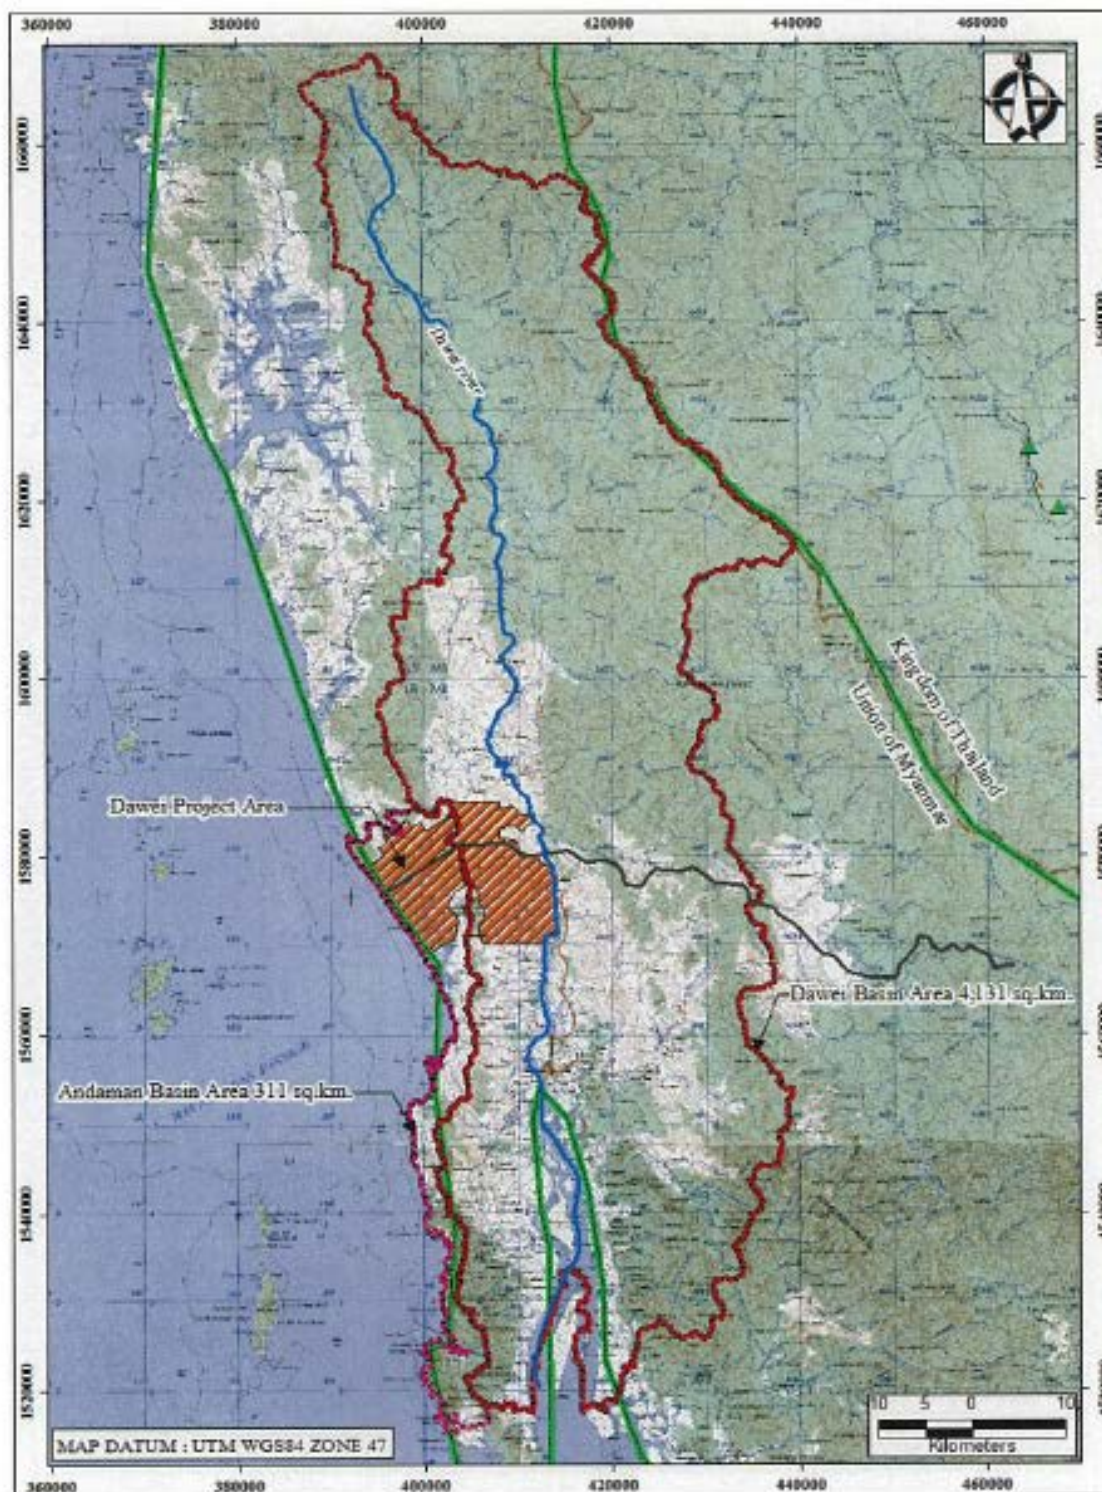

The description below discusses the regional geological settings of the area.

**Figure 5.2-4 Myanmar Soil Types**

### Results of the Studies

The Western part of Myanmar, called “Western Fold Belt”, mostly consists of very thick sequences of flysch type sedimentary rocks and tectonic mélange of basic and ultrabasic rocks and exotic limestone in the form of ophiolite. This is a result of the subduction of the Indian Tectonic Plate underneath the Burmese Tectonic Plate along the Bengal tectonic boundary. Continued collision between these two plates leads to a high mountain arc in the West and Northwestern parts of Myanmar (Pramumijoyo et al., 2010)

The project area is located in Q2-alluvial (Holocene), with reference to the Geological map of the Socialist Republic of the Union of Burma (USACE, 1977) (Figure 5.2-5). There is fine to coarse gravel and sand, silt, and light-to medium-gray and yellowish-gray clay.

The predominant rock types of the project area are hard and soft rocks which are mainly Basalt, rhyolite, tuff and volcanic ash. (see in Figure 5.2-6) Central Myanmar Basin and Central Andaman Basin records an active extensional process that varies laterally from continental rifting in the North and sea-floor spreading in the South. The majority of these volcanic rocks are volcanic ash, volcanic tuff, lava flow, different types of basalt, andesite, dolerite, and rhyolite. Bimodal basalt-rhyolite with the presence of intermediate composition and compositional variations of volcanic rocks indicate that the volcanic rocks were formed by assimilation and the fractional crystallization of the crustal components and magma mixing. Associated host rocks of the volcanic material are sedimentary rocks of the Peguan (Miocene) and Irrawaddian (Pliocene-Pleistocene). Volcanic occurrences are mostly in the Central Myanmar Basin and in the Andaman Sea.

#### **5.2.2.2 Baseline Seismological Conditions**

The key information referred to in this study related to seismological conditions include:

- The Volcanic Occurrences in relation to Tectonics in Central Myanmar Basin (Unknown Author, 2010)
- Seismic and Tsunami Activities in Myanmar (Lin, n.d.),

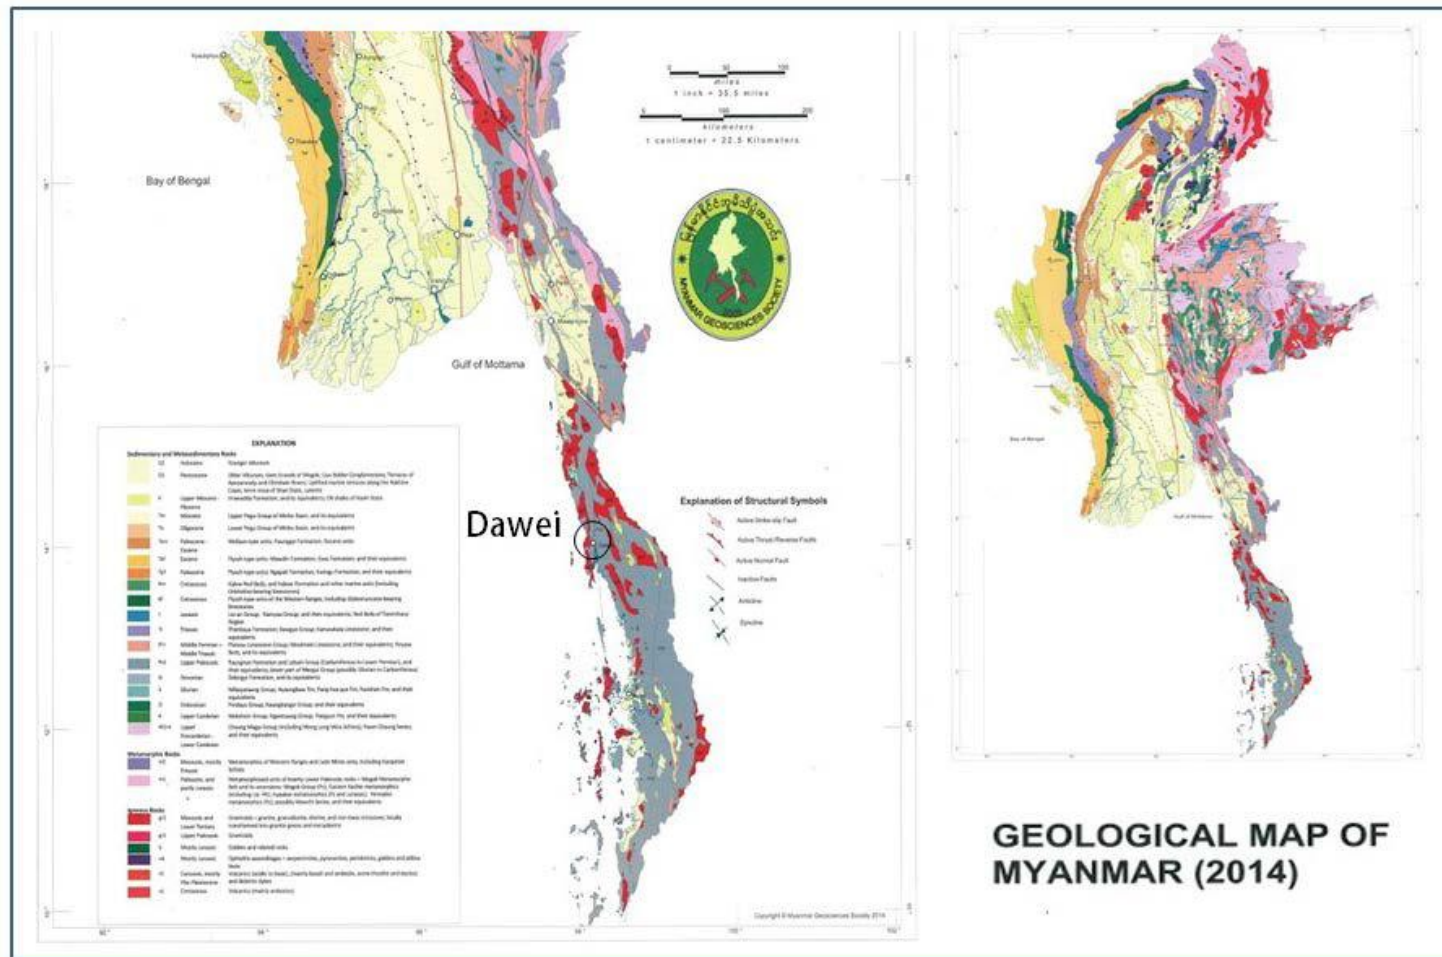

Figure 5.2-5 Geological Map of the Project Area

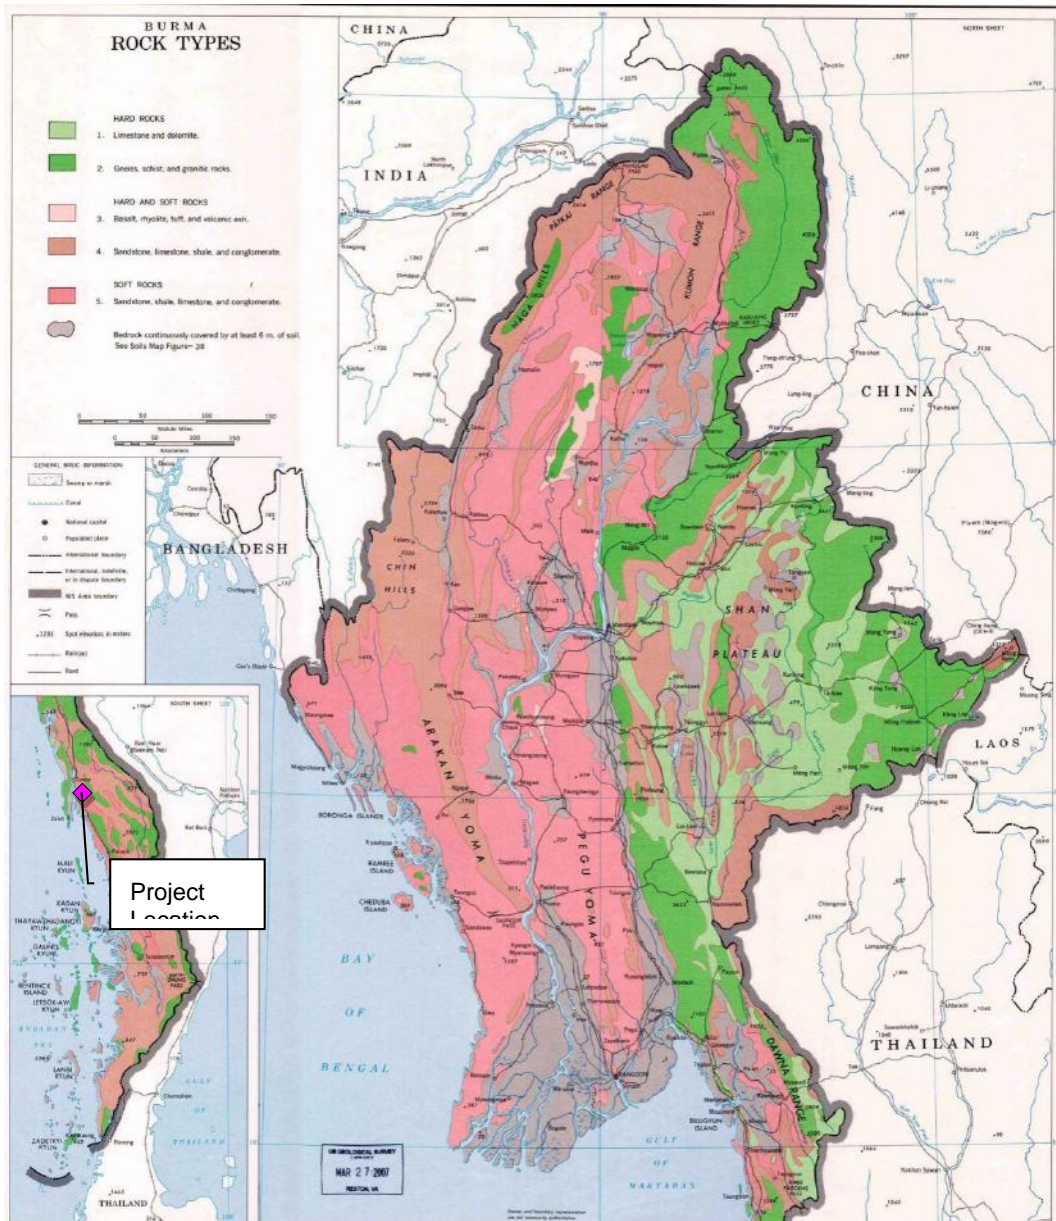

Figure 5.2-6 Rock types in project Area

Results of the Studies

*Seismic Zone Map*

The seismic zone map of Myanmar is shown in Figure 5.2-7 (The In and Swe, 2006). Five seismic zones are leveled from low to high risk zone, a probable maximum range of ground acceleration in (g) values and equivalent Modified Mercalli Scale classes are given for each zone. The descriptions of each zone are described:

- Zone V (Zone of very severe damage) - A range of ground acceleration more than 0.3 g, which is equivalent to Modified Mercalli Intensity (MMI) class IX.
- Zone IV (Zone of severe damage) – A range of ground acceleration 0.2-0.3 g, which is equivalent to MMI class VIII.

- Zone III (Zone of highly damage) – A range of ground acceleration 0.1-0.2 g, which is equivalent to MMI class VII
- Zone II (Zone of moderate damage) – A range of ground acceleration 0.075-0.1 g, which is equivalent to MMI class V/VI
- Zone I (Zone of minor damage) - A range of ground acceleration less than 0.075 g, which is equivalent to MMI class V and less.

The project area located in Zone I, which is of minor damage, can be seen in Figure 5.2-7.

### *Seismic History*

Myanmar lies on the earthquake belt of the Himalayan range. The Northeastern part of the Indian plate subcontinent is seismically active. It comprises of East-West extending the Eastern Himalayan belt, which marks the collision boundary between the under thrusting Indian plate and the Eurasia plate; approximately N-S extending Indo-Burmese Arc (IBA), which extends further Southward to join the Andaman Arc and Eastern Himalayan Syntaxes (EHS). Subduction occurs along the Andaman arc. The Indian (IN) plate moves with respect to the Eurasian plate (EU), and is highly oblique to the margin on the subduction zone. The right-lateral Sagaing shear fault, shown in Figure 5.2-8, is delineated in the West by the Andaman-Nicobar Trench.

The Department of Meteorology and Hydrology (DMH) started to observe the sea level after the Great Sumatra Earthquake of 2004. The seismic record shows that there have been at least 15 major earthquakes bearing magnitude  $M \geq 7.0$  within the territory of Myanmar for the past 100 years. The seismicity in Myanmar is attributable to the following two reasons:

- The continued subduction (with collision only in the North) of the Northward-moving Indian Plate underneath the Burmese Platelet (which is a part of the Eurasian Plate) at an average rate of 5.5 cm/yr.
- The Northward movement of the Burmese Platelet from a spreading centre in the Andaman Sea at an average rate of 2.5-3.0 cm/yr. Very large over thrusts along the Western Fold Belt resulted from the former movement, and the Sagaing and related faults from the latter movement. Intermittent jerks along these major active faults resulted in the majority of earthquakes in Myanmar.

According to the information from Myanmar Earthquake Committee (MEC), the seismic records indicated that during 1912-2011 there were at least 14 major earthquakes (Richter Scale  $\geq 7.0$ ) in Myanmar and nearby regions, however, no earthquakes occurred in Dawei and the project area. The frequency with respect to time is summarized in Table 5.2-1. and Table 5.2-2.

### *Tsunami*

Tsunamis were caused by earthquakes at sea. A notable incident occurred due to an earthquake west of North Sumatra, on 26 December, 2004. An earthquake, with a magnitude of 9.0 on the Richter scale, jolted at the bottom of the sea about 155 miles Southeast of Banda Aceh in North Sumatra. The epicenter of the earthquake was between 3°31' North and 95°97' East, off the West coast of North Sumatra. This Tsunami arrived in Myanmar only with a height of three to seven feet. The Tsunami disaster left 31 people dead, 41 injured, 517 homes destroyed, and 2,145 persons homeless in Ayeyawady Division; 8 dead, 1 injured, 83 homes destroyed, and 447 persons homeless in Taninthayi Division; 22 dead but without damages to homes in Rakhin State; and 1 home damaged in Yangon Division. Historically, a tsunami recorded at the Myanmar coast showed that a strong earthquake, with associated ground movements, along the Arakan coast were recorded during a survey in 1841 by the British ship Childers<sup>18</sup>, commanded by Captain E. Halsted. Halsted recorded evidence of 3-7 m. of uplift along the coasts of Ramree, Cheduba, and Foul islands, which lie offshore of and parallel to the Arakan coast of Myanmar. Another earthquake, with a magnitude of 7.9 on the Richter scale, took place at Nicobar Islands on 31 December 1881 and another earthquake with magnitude of 8.7 Richter scale occurred at Andaman Islands on 26 June 1941 (Lin, n.d.).

The recent recorded effect of the tsunami to the Myanmar coast was relatively small. Based on post-tsunami site reconnaissance surveys after the earthquake on 26 December 2004 (Satake et al., 2005), the wave height along the Myanmar coast was generally in the range of 1 to 3 m., and are estimated to be in the range of 2 m. at the project site. The maximum water level recorded (based on observations) was 0.5 m. lower than the highest tide during that particular rainy season (Satake et al., 2005). There was no observed major shoreline damage along the Dawei coast in terms of large areas of sediment loss or accretion.

## **5.2.3 Hydrology**

### **5.2.3.1 Study Area**

There are four rivers within the project site: Nabule River; Dawei River; Kunchaung River; and Pan Din In Chaung River. In the case of project development, all four rivers and their tributaries may be adversely affected by project construction activities. The effects might include an increase of sediments, or a change in river velocity or direction.

### 5.2.3.2 Baseline Hydrological Conditions

Hydrological conditions of the project areas in the previous studies can be found in the following documents.

- Final Report: Task 2: Industrial Estate Flood Control & Drainage Study and Conceptual Design (SEATEC, 2012b)
- Final Report of Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013)
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

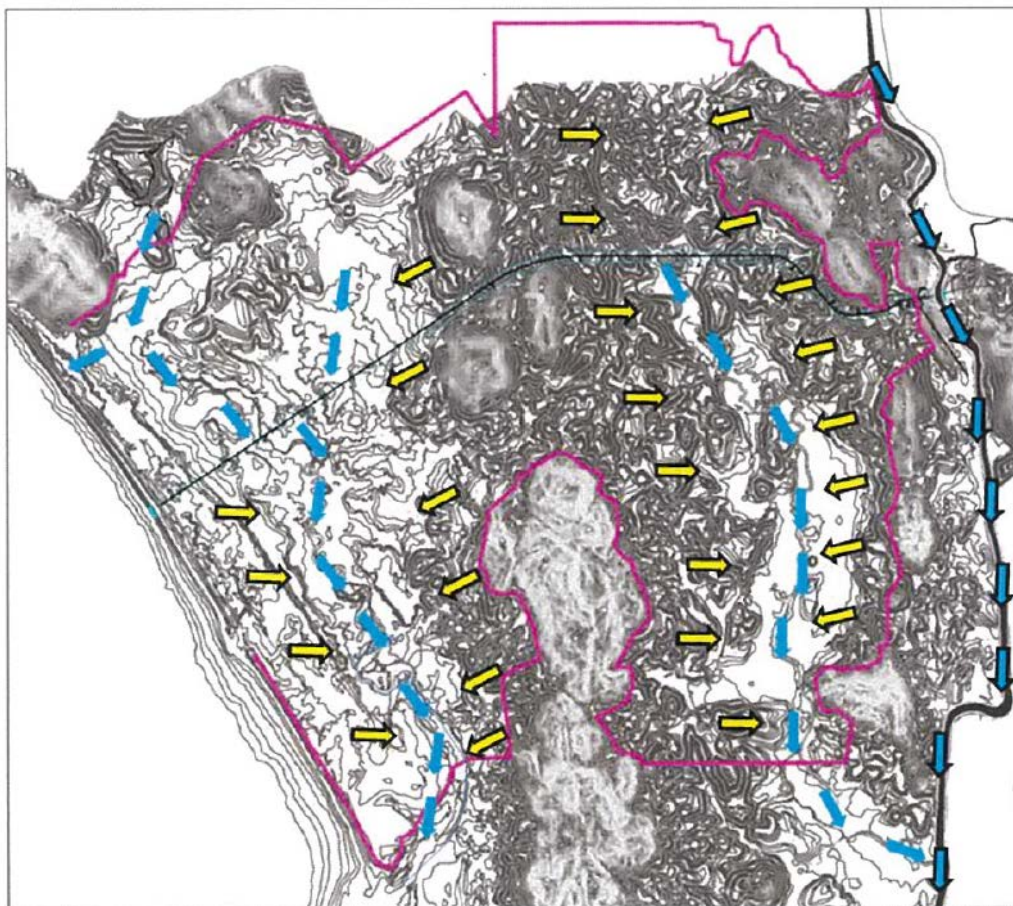

Summary of the key hydrological conditions of the project area is as follow.

#### Results of the Studies

Referring to flood study in the project area, there are four main rivers near and within the project area including:

- Dawei River – Dawei River or Tavoy River is a river of Myanmar and is the primary river in this area, flowing from North to South at the foothills of the Taninthayi mountain range and enters into the Andaman Sea at the Taninthayi Coast Region. The river is located at the project boundary in the East. There are many tributaries flowing into Dawei River from East and West. The river delta is brackish.
- Nabule River – this river originates from Hinchang and Madu Chang at the Northeastern part of the project area near the Htein gyi village. It flows from North to South, parallel with the coast, and ends in the Andaman Sea, around 1.5 kilometers outside the project area. The river delta is brackish.
- Kunchaung River (Kyaing Chaung) – this river is a combination of many canals in the North: Sin Pu Nit Chaung; Pein Shaung Chaung and Ya Laing Chaung. It flows from North to Northeast and empties into the Dawei River.
- Pan Din In Chaung River – this river flows from East to West and ends in the Andaman Sea. The river originates from the hills to the South of the project area. This river delta is brackish.

The natural drainage system of the project area is composed of two sub basins. On the Eastern sub basin, water is flowing to the Dawei River through a natural stream which carries the water along the main slope of the terrain in a North- South direction, and the accumulated water from the hills along the left side and the right side of the bank. The hillside water flows along the minor slope in the direction perpendicular to the main slope from East to West and West to East. These two sources of water are then drained to the Dawei River at the Yebyu community (Figure 5.2-9). The sub basin in the Western is similar to the Dawei river sub basin; i.e., the water flow from upstream along the main slope in North-South direction combines with the accumulated flow from the hills along the left side and right side of the bank. The hillside water flows along the minor slope in the direction perpendicular to the main slope from East to West and West to East. These will be drained to the Andaman Sea around the Pan Din-in community.

**Figure 5.2-9 Topographic Condition and the Main Slope of the Project Area**

The watershed in the project area is in Dawei basin. Natural water course flows from North to South and joins the Dawei River (Figure 5.2-10).

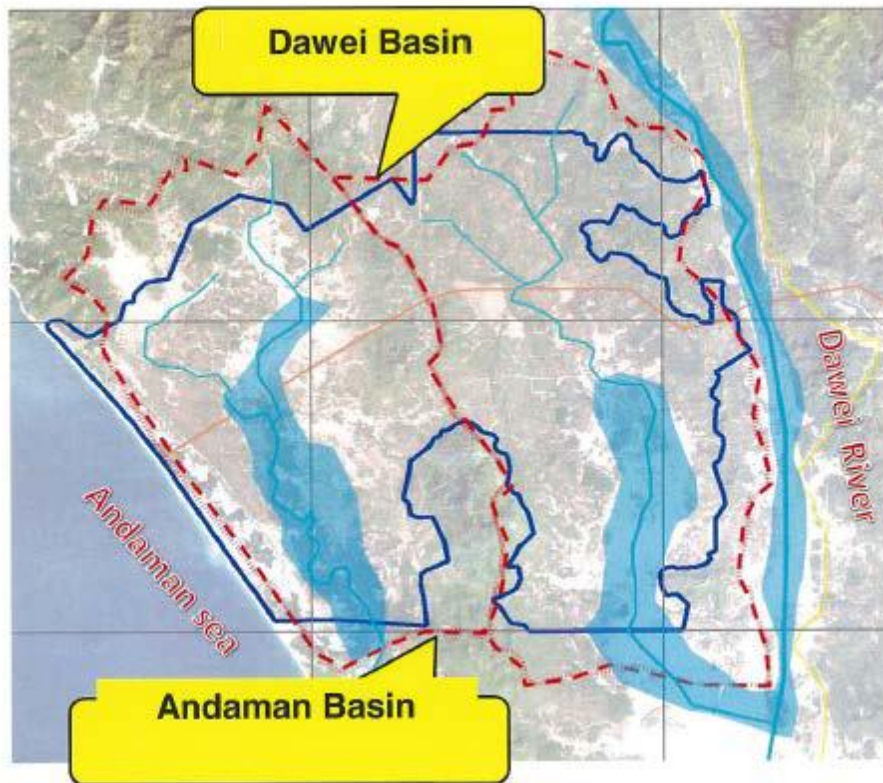

Figure 5.2-10 Basins in Dawei Project Area

Referring to the information from site reconnaissance by SEATEC (2012b), the maximum flood occurred on 10 August 2006 with the highest water level at + 13.0 m. due to the overflow of Dawei River into the Dawei basin of the project. The Andaman basin inundates throughout the year, especially downstream of the basin, because the lowland nature of the area. The flood map of the historical events is depicted in Figure 5.2-11.

## 5.2.4 Climate and Air Quality

### 5.2.4.1 Study Area

The study area will cover the project boundary and the area potentially impacted by the project activities. For the study of climate, the secondary data from the local government in the adjacent area will be considered. For the study of air quality, the area both up and downwind of the study area will be covered. Also, the nearest sensitive area and permanent area of impact will be considered for ambient air quality.

Figure 5.2-11 Historical Flood Map of Dawei Basin in August 2006

#### 5.2.4.2 Baseline Climate Conditions

The following previous studies in the area of Initial Township project are reviewed:

- The Geology of Myanmar: An Annotated Bibliography of Burma's Geology, Geography and Earth Science (USACE, 2008).
- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

Details of the methodology and results of the previous surveys and studies are summarized below.

##### Precipitation

The coastal region of Myanmar normally receives more than 200 inches (5,000 mm) of precipitation, annually (USACE, 2008). The average annual rainfall from 1961-1990 in Dawei was in the range of 5,500-6,000 mm/year which was the zone with the highest rainfall in Myanmar. The highest rainfall recorded was 1,342 mm, occurring in August while the lowest rainfall recorded was 5 mm, occurring in December (Figure 5.2-12).

Considering the thirty year record from the Meteorological and Hydrological Department of Myanmar (TEAM, 2012a), the highest rainfall recorded from 1979-2008 was 7,208.27 mm. in 1999, and the lowest was 4,027.17 mm. in 1988 (Table 5.2-3). From 1999-2010, the highest amount of rainfall was 6,818 mm. in 2006 and lowest was 3,068 mm. in 2010. The maximum average monthly rainfall generally occurred in August/July and the minimum average monthly rainfall generally occurred in December/January (Table 5.2-4).

### Monsoons

The monsoonal climate of the area along the coast of Andaman Sea is generally hot and humid. From December to March, the temperature, humidity, and rainfall tend to be lower; therefore, it is known as the dry season. Violent thunderstorms occur during the wet season, mid-May to the end of September, forming from the South-West; while typhoons or hurricanes usually form to the South, West, and North of the Andaman Sea (Figure 5.2-13). The frequency of tropical cyclonic storms in the Bay of Bengal during 1891-1960 is shown in Figure 5.2-14.

Myanmar has a monsoon climate with three main seasons: the hot season; the rainy season and the cool season. The hottest season is between February and May, with little or no rain. At the end of this season, generally from March to April, the average monthly temperature reaches the upper 30's °C in many parts of Myanmar. The monsoon, or rainy, season occurs from May to October. During this rainy season, rain falls nearly every day, and sometimes all day long. Almost all of Burma's annual rainfall occurs during rainy season. Rainfall during the monsoon season totals more than 250 cm. (100 in.) in lower Myanmar. The annual precipitation in most of lower Myanmar averages about 5,080 mm. (about 200 inch.). The climate is tropical; with wet, hot, and humid summers during the height of the monsoon season, from June to September. The cool season runs from late October to mid-February. The temperature for January averages 25°C in Lower Myanmar. The average daily temperatures in Yangon range from 18°C to 32°C in January (USACE, 2008).

### Temperature

The mean annual temperature is 27°C. Although Myanmar is a tropical country, temperatures are not uniformly high throughout the year. The average daily temperatures in lower Myanmar, especially in the river delta and along the coastal regions, are the most humid. The coastal and delta regions have a mean annual temperature of 32°C (USACE, 2008).

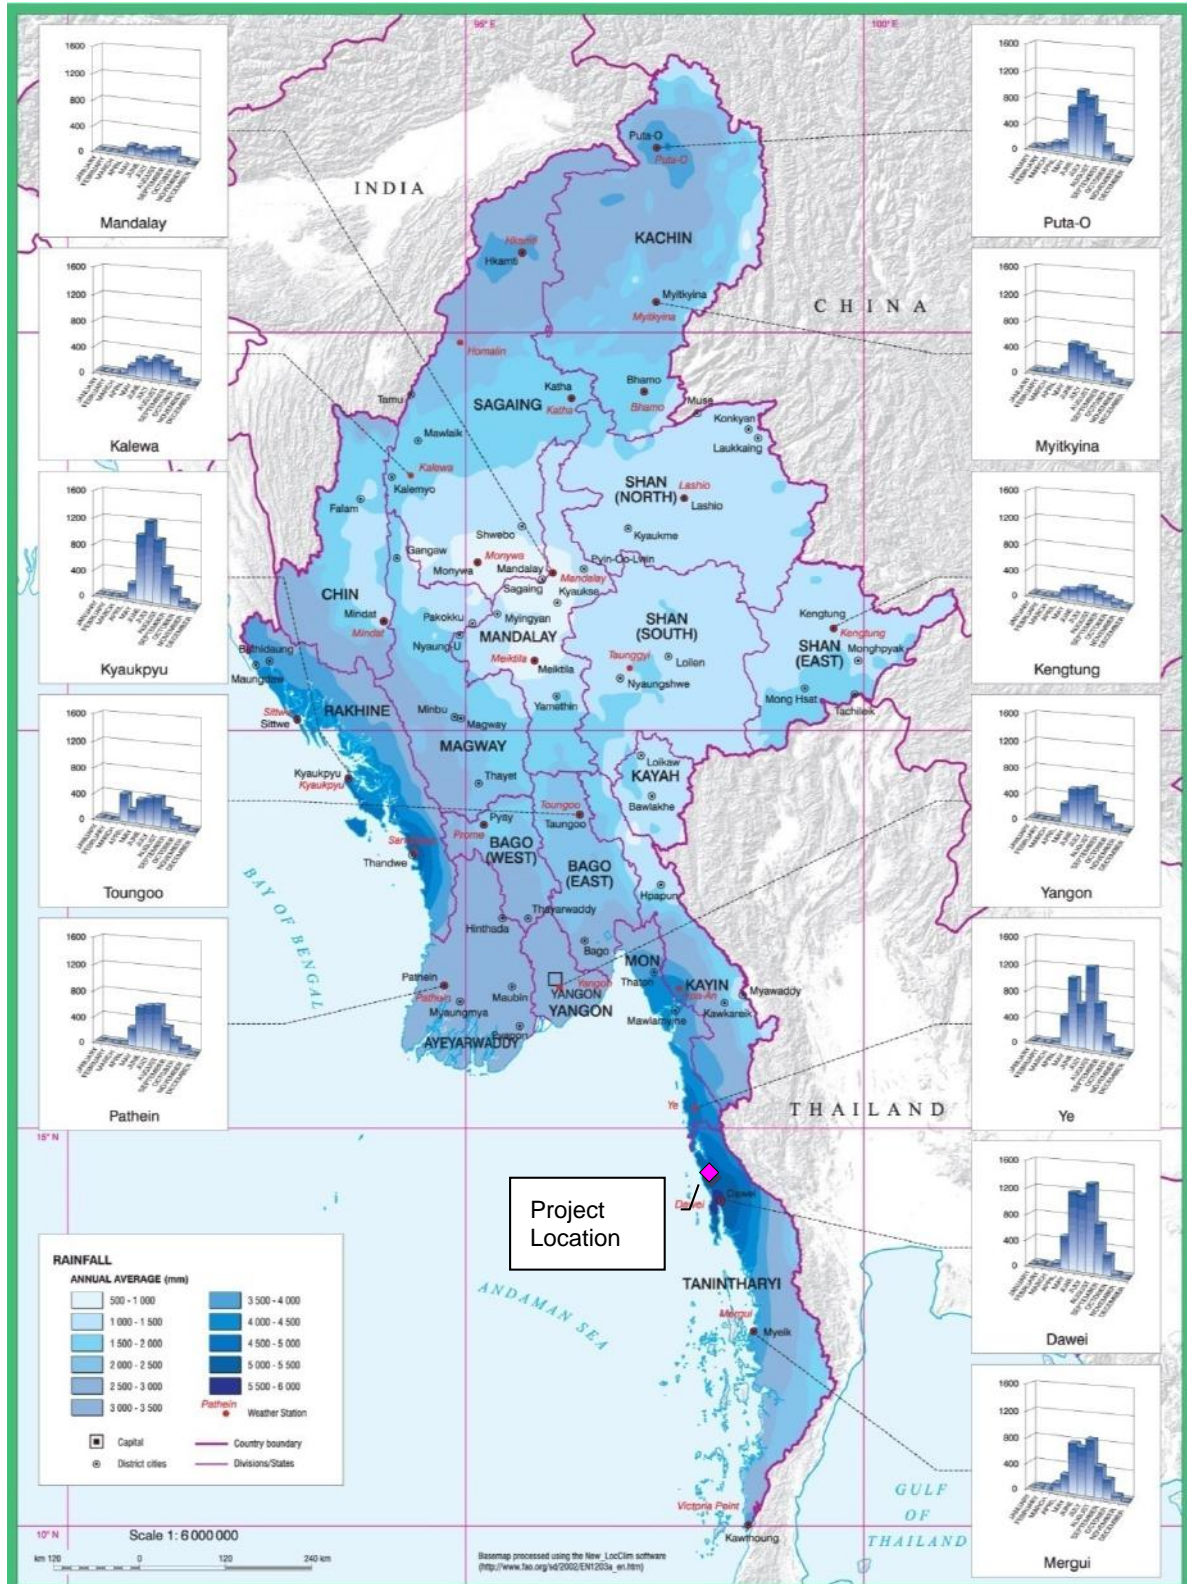

According to the TEAM (2012a), the recorded average temperature of Dawei Meteorological Station from 1991-2005 is ranged from 32°C in December to 34°C in April. Annual Average temperature in the Yebyu Township, Dawei area, from 1991 to 2005, is presented in Table 5.2-5.

**Table 5.2-3 Annual Rainfall of Dawei Area (1979-2008)**

### 5.2.4.3 Baseline Air Quality Conditions

#### (a) Results from Previous Surveys and Studies

The following previous studies in the area of Initial Township Project are reviewed:

- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Final Report of Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013).
- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012a)
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

Details of the methodology and results of the previous surveys and studies are summarized below.

#### Methodology

- There are 4 stations for air quality measurement from the previous studies:
  - Station A3: The Construction Area (396,389 E, 1,577,260 N)
  - Station A4: The Guard House (399,444 E, 1,578,143 N)
  - Station A5: Km. 4+500 of Main Road (399,211 E, 1,578,342 N)
  - Station A6: Km. 18+900 of Main Road (412,483 E, 1,580,131 N)
- The sampling stations are shown in Figure 5.2-15.
- The analysis methods and sampling period of each parameter are concluded in Table 5.2-6.

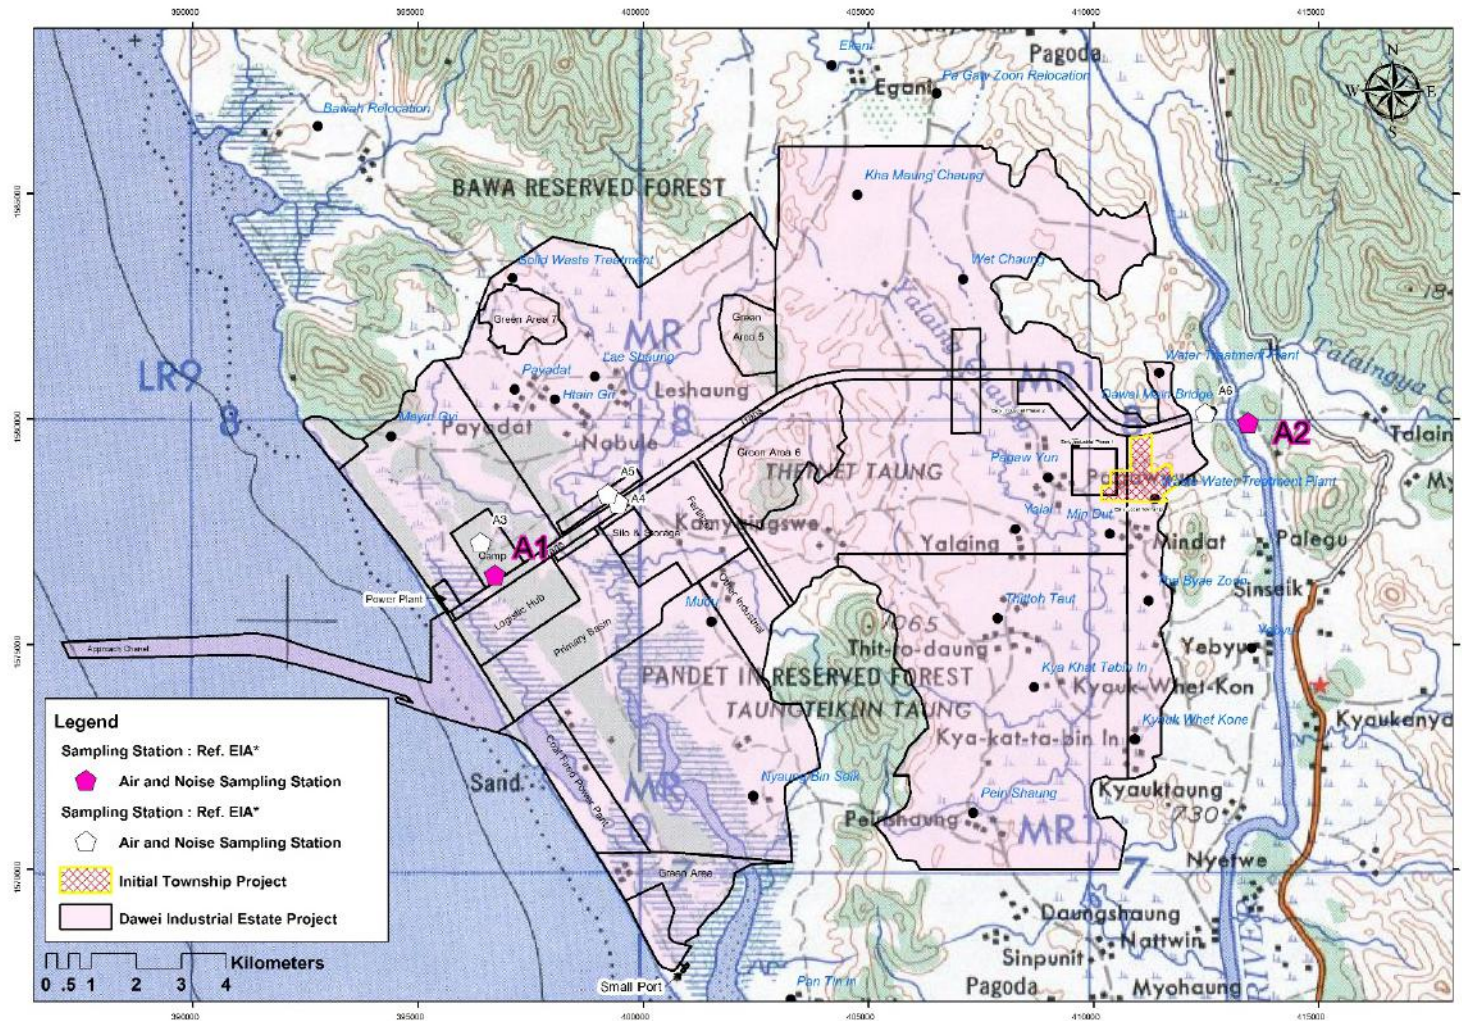

Figure 5.2-15 Air Quality and Noise Measurement Stations Compared with Stations of This EIA Study

**Table 5.2-6 Analysis Methods and Sampling Period of the Collected Air Quality Data**

Parameter	Analysis method	Sampling period	Sampling date	Station
TSP-Avg 24 hrs	Gravimetric	72-hour	17-23 Oct 11/ 1-5 Apr and 24-27 May 12	A3, A4, A5, A6

			24-27 May 12	A5, A6
THC	Flame Ionization Detection Method	72-hour	3-5 Apr 12	A5, A6
MHC	Flame Ionization Detection Method	72-hour	3-5 Apr 12	A5, A6
NMHC	Flame Ionization Detection Method	72-hour	3-5 Apr 12	A5, A6

Results of the Studies (A3-A6)

From the previous studies (Table 5.2-7), the concentration of Total Suspended Particulate (TSP) concentration average 24 hours and Particulate Matter less than 10 micron (PM<sub>10</sub>) average 24 hours were quite high compared to the other pollutants, especially during the dry season. The maximum concentration of PM<sub>10</sub> during the dry season, for station A5 and A6, exceeded WHO ambient air quality guidelines, but there were well within the U.S. EPA National Ambient Air Quality Standards. The concentration of gas pollutants: Sulfur Dioxide (SO<sub>2</sub>), Nitrogen Dioxide (NO<sub>2</sub>) and Carbon Monoxide (CO) were within the World Bank Group, U.S. EPA and WHO standards. The Total Hydrocarbon (THC), Methane Hydrocarbon (MHC) and Non-Methane Hydrocarbon (NMHC) were measured in preparation of baseline data, even though there were no standards given.

**Table 5.2-7 Result of the Reviewed Air Quality Data from Previous Studies**

Parameter	Unit	Dry Season		Wet Season				Standard
		A5	A6	A3	A4	A5	A6	
TSP- 24 hrs	µg/m <sup>3</sup>	163-198	116-212	16.74-36.60	42.60-64.89	18-27	13-19	230 <sup>1/</sup>

(b) Results from Baseline Monitoring

- There are two stations for air quality measurement:
  - Station A1: VIP Resident at ITD Camp (396,821 E, 1,576,646 N)
  - Station A2: Doot Loot Temple (413,446 E, 1,579,929 N)
- The sampling stations are shown in Figure 5.2-15
- The analysis methods and sampling period of each parameter are concluded in Table 5.2-8.

**Table 5.2-8 Ambient Air Quality Parameters**

Parameters	Method <sup>1/</sup>	Sampling period	Sampling date	Sampling Station
Total Suspended Particulate (TSP) average 24 hours	Gravimetric High Volume (pre and post weight)	72-hour	2-5 December 2012 and 4-7 March 2013	A1: behind VIP Resident at ITD Camp
Particulate Matter less than 10 µm (PM <sub>10</sub> ) average 24 hours	Gravimetric High Volume (pre and post weight)	72-hour	2-5 December 2012 and 4-7 March 2013	A2: Doot Loot Temple
Sulphur Dioxide (SO <sub>2</sub> ) average 1, 24 hours	UV Fluorescence	72-hour	2-5 December 2012 and 4-7 March 2013	
Nitrogen Dioxide (NO <sub>2</sub> ) average 1 hour	Chemiluminescence	72-hour	2-5 December 2012 and 4-7 March 2013	
Carbon Monoxide	Non-Dispersive Infrared (NDIR)	72-hour	2-5 December 2012 and 4-7 March 2013	
THC/MHC/NMHC	FID Method (Sampling Bag 24 hours)	72-hour	2-5 December 2012 and 4-7 March 2013	
Wind speed and direction	Instrument for wind speed and wind direction (Cup Anemometer and Wind Vane)	72-hour	2-5 December 2012 and 4-7 March 2013	

Remark: <sup>1/</sup> U.S.EPA, Code of Federal Regulation

Results of the Studies (A1-A2)

*Total Suspended Particulate, 24 hours Average*

The measurement methodology performed for TSP sampling and measurement is Gravimetric High Volume Method. TSP was sampling by using a High Volume Air Sampler model GL2000H- 1, Thermo Andersen, product of Thermo Electron Corporation, Environmental Instruments, USA, with flow rate of 1.13- 1.70 m<sup>3</sup>/minute continuously for 24 hours by pumping air sample passing through a weighted 8x10 inches glass fibre filter. The sample filter was taken back to the laboratory for analysis by Pre and Post Weight Different Method as the recommendation of U.S. Environmental Protection Agency (U.S.EPA, 2011) followings are performed procedures for TSP measurement.

- Prepared and performance checking the High Volume Air Sampler before field measurement.
- Desiccated glass filter paper size 8x10 inches for 24 hours in order to control humidity at 30-50 %R.H., weighted the filter with calibrated 4 decimals electrical balance, stamp number on each filter paper and record weight and number in logbook. Prepared flow chart papers for flow recording.
- Moved sampler to sampling station, site is not obstructed in 10 metres radius and no point source is close to the sampler as recommended by U.S.EPA. Filter holder was equipped at 1.5-6.0 metres from ground. Recorded environmental condition in field logbook.
- Calibrated High Volume Air Sampler with Standard Certified Orifice at sampling site for 5 times before the sampling and record in Field Data Sheet.
- Pumped air sample with flow rate of 1.13-1.70 m<sup>3</sup>/minute continuously for 24 hours through glass fibre filter, take sample filter, flow chart paper and field data sheet to the laboratory for analysis.
- Laboratory analysis was performed by putting sample filter in desiccators for 24 hours to control humidity at 30-50 %R.H., weigh sample filter with calibrated 4 decimal electrical balances. Calculate TSP weight by Pre and Post Weight Different method.
- Calculated flow rate from Flow Chart Paper at 25 °C temperature and 760 mm Hg pressure.
- Calculated and reported TSP result average for 24 hours as mg/m<sup>3</sup> by gravimetric method. Determined the monitoring results with Ambient Air Quality Standards.

#### *Particulate Matter Less Than 10 Microns, 24 hours Average*

The measurement methodology performed for particulate which size is less than 10 microns (PM<sub>10</sub>) is gravimetric method. PM<sub>10</sub> was sampling by High Volume Air Sampler model IP10, Thermo Andersen, product of Thermo Electron Corporation, Environmental Instruments, USA, and taken sample filter from the field to the laboratory for analysis by Pre and Post Weight Different Method as the recommendation of US.EPA. (2011). The measurement procedures were complied with ISO/IEC 17025 as followings;

- Prepared and performance checking the High Volume Air Sampler and size selective head before field measurement.
- Desiccated quartz filter paper size 8x10 inches for 24 hours in order to control humidity at 30-50 %R.H., weigh the filter with calibrated 4 decimal electrical balances, and stamp number on each filter paper and record weight and number in logbook. Prepared flow chart papers for flow recording.
- Moved sampler to sampling station, site is not obstructed in 10 metres radius and no any point sources is close to the sampler as recommended by U.S.EPA. Filter holder was equipped at 1.5-6.0 metres from ground. Recorded environmental condition in field logbook.
- Calibrated High Volume Air Sampler with Standard Certified Orifice at sampling site for 5 times before the sampling and recorded in Field Data Sheet. Sprayed Silicone Grease on Impactor of size selective head for sampling of particulate size less than 10 microns.

- Pumped air sample with flow rate of 1.13 m<sup>3</sup>/minute continuously for 24 hours through glass fibre filter, take sample filter, flow chart paper and field data sheet to the laboratory for analysis.
- 24 hours through quartz fibre filter, took sample filter, flow chart paper and field data sheet to the laboratory for analysis.
- Calculated flow rate from Flow Chart Paper at 25 °C temperature and 760 mm Hg pressure.
- Reported PM<sub>10</sub> result average for 24 hours as mg/m<sup>3</sup> by gravimetric method.

#### *Sulphur Dioxide Average 1 and 24 hours*

Measurement of 1 and 24 hours average ambient sulphur dioxide was conducted by UV Fluorescence method as recommended by the National Environment Board and compliance with U.S.EPA (2011) recommendation procedure as follows;

- Checked SO<sub>2</sub> gas analyzer and associate instruments such as sampling probe, sampling pump, mass flow meter and controller, etc.
- Moved a mobile laboratory to a selected measuring site at open wide area which no obstruction in a perimeter of 10 meters, far away from another gas source, etc and sampling probe must be installed at 3.00-6.00 meters height. Recorded surrounding condition of selected site in a Field Data Sheet.
- Supplied electricity to the station and then warming up the analyzer of about 1-2 hours. Tested analyzer condition, reaction chamber and photo-multiplier tube are recommended in operation manual. If the condition is functioned then starting calibration.
- Supplied zero gas (SO<sub>2</sub> Free) from Zero Gas Generator for zero calibration. Then supplied Span gas from a Certified Standard SO<sub>2</sub> (N<sub>2</sub> Balanced) through Standard Gas Generator. The generator is a dynamic diluter that can generate specified span gas. Span calibration was done at 80-85%, full scale of measuring range.
- Measured sulphur dioxide consecutively throughout the period. Re-calibration was done every 24 hour for good performance.
- Start up procedure and calibration when relocate the mobile unit.
- Measuring results were recording by a Data Logger and a strip chart recorder, reported by comparing sulphur dioxide level with Ambient Air Quality Standards.

#### *Nitrogen Dioxide Average 1 hour*

Nitrogen Dioxide in Ambient Air monitoring was conducted by Nitrogen Dioxide in ambient air analyzer with Chemiluminescence system as recommended by the National Environment Board compliance with U. S. EPA (2011). The analyzer installed in temperature controller room at the mobile laboratory to prevent the impact from the outside temperature. This analyzer was inspected and calibrated with Multipoint Calibration, Then can use the analyzer to monitoring. The details as follows;

- Checked NO/NO<sub>2</sub> gas analyzer and associate instruments such as sampling probe, sampling pump, mass flow meter and controller, etc.
- Moved a mobile laboratory to a selected measuring site at open wide area which no obstruction in a perimeter of 10 meters, far away from another gas source, etc.

Sampling probe must be installed at 3.00-6.00 meters height. Recorded surrounding condition of the selected site in a Field Data Sheet.

- Supplied electricity to the station and warmed up the analyzer for 1-2 hours. Tested analyzer condition, reaction chamber and photo-multiplier tube are recommended in operation manual.
- Supplied zero gas (NO/NO<sub>2</sub> Free) from zero gas generator for zero calibration and supplied Span gas from a certified standard NO (N<sub>2</sub> Balanced) through standard gas generator. The generator is a dynamic diluter that can generate specified span gas. Span calibration was done at 80-85%, full scale of measuring range.
- Measured ambient nitrogen dioxide consecutively throughout the period. Re-calibration was done every 24 hour for good performance.
- Relocated of the mobile and started up procedure and calibration.
- Measuring results were recorded by a data logger and a strip chart recorder, reported by comparing nitrogen dioxide level with ambient air quality standards.

#### *Carbon Monoxide, 1 hour Average*

Measuring of ambient carbon monoxide was done by Non-dispersive Infrared (NDIR) method as recommended by the National Environment Board (NEB). CO analyzer was operated under QA/QC during the 3-day measurement complying with U.S.EPA. (2011) method as follows:

- Moved mobile unit that equipped with CO analyzer into monitoring station.
- Supplied electricity to the analyzer and then warming up the analyzer of about 1-2 hours. Then testing analyzer condition as recommended in operation manual, starting calibration when analyzer condition is functioned.
- Supplied zero gas (CO Free) from Zero Gas Generator for zero calibration. Then supply Span gas from a Certified Standard CO (N<sub>2</sub> Balanced). Span calibration will be done at 80-85% full scale of measuring range.
- Measured ambient carbon monoxide (CO) that sampling will be done every hour for 3 consecutive days.

#### *THC/MHC/NMHC*

Measurement of total hydrocarbons (THC), methane and non-methane hydrocarbon, was done by THC analyzer. An analyzer was installed in a mobile laboratory that could be easily moved to the measuring site. The measurement procedures were complied with U.S.EPA. (2011) recommendation as follows:

- Checked THC analyzer and associate instruments such as sampling probe, sampling pump, mass flow meter and controller, etc.
- Moved a mobile laboratory to the selected measuring site at open-wide area which has no obstruction in a perimeter of 10 meters and is far away from another gas source, etc., installed sampling probe at 3.0-6.0 meters height and recorded surrounding conditions of the selected site in a field data sheet.
- Supplied electricity to the station, then warmed up the analyzer for 1-2 hours and tested analyzer condition as recommendation in operation manual.

- Supplied zero gas (hydrocarbon free) from zero gas generator for zero calibration and span gas from a certified standard methane/propane (air balanced) through standard gas generator.
- The generator is a dynamic diluter that can generate specified span gas. Span calibration was done at 80-85%, full scale of measuring range.
- Measured THC, MHC and NMHC, consecutively throughout the period. Re-calibration was done every 24 hours for good performance. Sample was taking by tedlar sampling bag during Re-calibration time.
- Relocated the mobile and started up procedure and calibration.
- Measuring results were recorded by a data logger and a strip chart recorder.

#### *Wind speed and direction*

Recorded wind speed and wind direction while sampling air pollutants at site. Cup anemometer and a wind vane, met one, model 034, product of Met One Instrument Inc. USA was installed at 10 meters above ground with open ground no building, construction or tree higher than 10 m. around the meter. The results were transformed to electric signal to collecting in data logger. The data in data logger was transferred to personal computer with MET-1's software and the measurement results were calculated and presented in wind rose diagrams.

#### Ambient Air Quality Baseline Monitoring Results

##### *Station A1: VIP Resident at ITD Camp*

Air Ambient Quality was sampled between 2-5 December 2012 and 4-7 March 2013, the result of Total Suspended Particulate (TSP) concentration average 24 hours were between 122-142  $\mu\text{g}/\text{m}^3$  and 120-210  $\mu\text{g}/\text{m}^3$ , Particulate Matter Less than 10 micron ( $\text{PM}_{10}$ ) average 24 hours were between 63-90  $\mu\text{g}/\text{m}^3$  and 84-104  $\mu\text{g}/\text{m}^3$ , respectively. Most of particulate matter results were not over standard except  $\text{PM}_{10}$  which complied with the recommendations of the World Bank (World Bank, 1999) and U.S.EPA (U.S.EPA., 2011) but did not comply with the recommendation of WHO (WHO, 2006).

The major activities, which may cause high concentrations of  $\text{PM}_{10}$ , may include: dust dispersion from road transportation near sampling station, and emission from diesel-engine vehicles, such as trucks and heavy equipments, or machines. Dry weather could also be another factor for high levels of TSP and  $\text{PM}_{10}$ . Additionally, higher  $\text{PM}_{10}$  in the second survey may be constituted by nearby construction activities. The concentrations of  $\text{NO}_2$  (1 hour) from both sampling events were between 0.0006-0.0072 ppm and 0.0019-0.0096 ppm, respectively. CO concentrations (1 hour) were between 0.29-1.57 ppm and 0.53-1.97 ppm, respectively. The concentrations of  $\text{SO}_2$  (1 hour) from both sampling periods were between 0.0008-0.0053 ppm and 0.0035-0.0245 ppm and the concentration of  $\text{SO}_2$  (24 hours) were between 3.93-6.02  $\mu\text{g}/\text{m}^3$  and 4.45-5.76  $\mu\text{g}/\text{m}^3$  respectively. The results of these parameters are within standards (Table 5.2-9). THC, MHC and NMHC were measured as baseline data despite of no standard requirements (Table 5.2-10).

As can be seen from the Table 5.2-11 and Figure 5.2-16, the wind direction at Station A1 from both sampling periods were predominantly came from North North East (NNE) and West South West (WSW). The air quality results of A1 station are not much different from the results collected during the dry season from previous studies. This is mainly because the activities in the study area are quite similar, construction of the access road, and clearing the land.

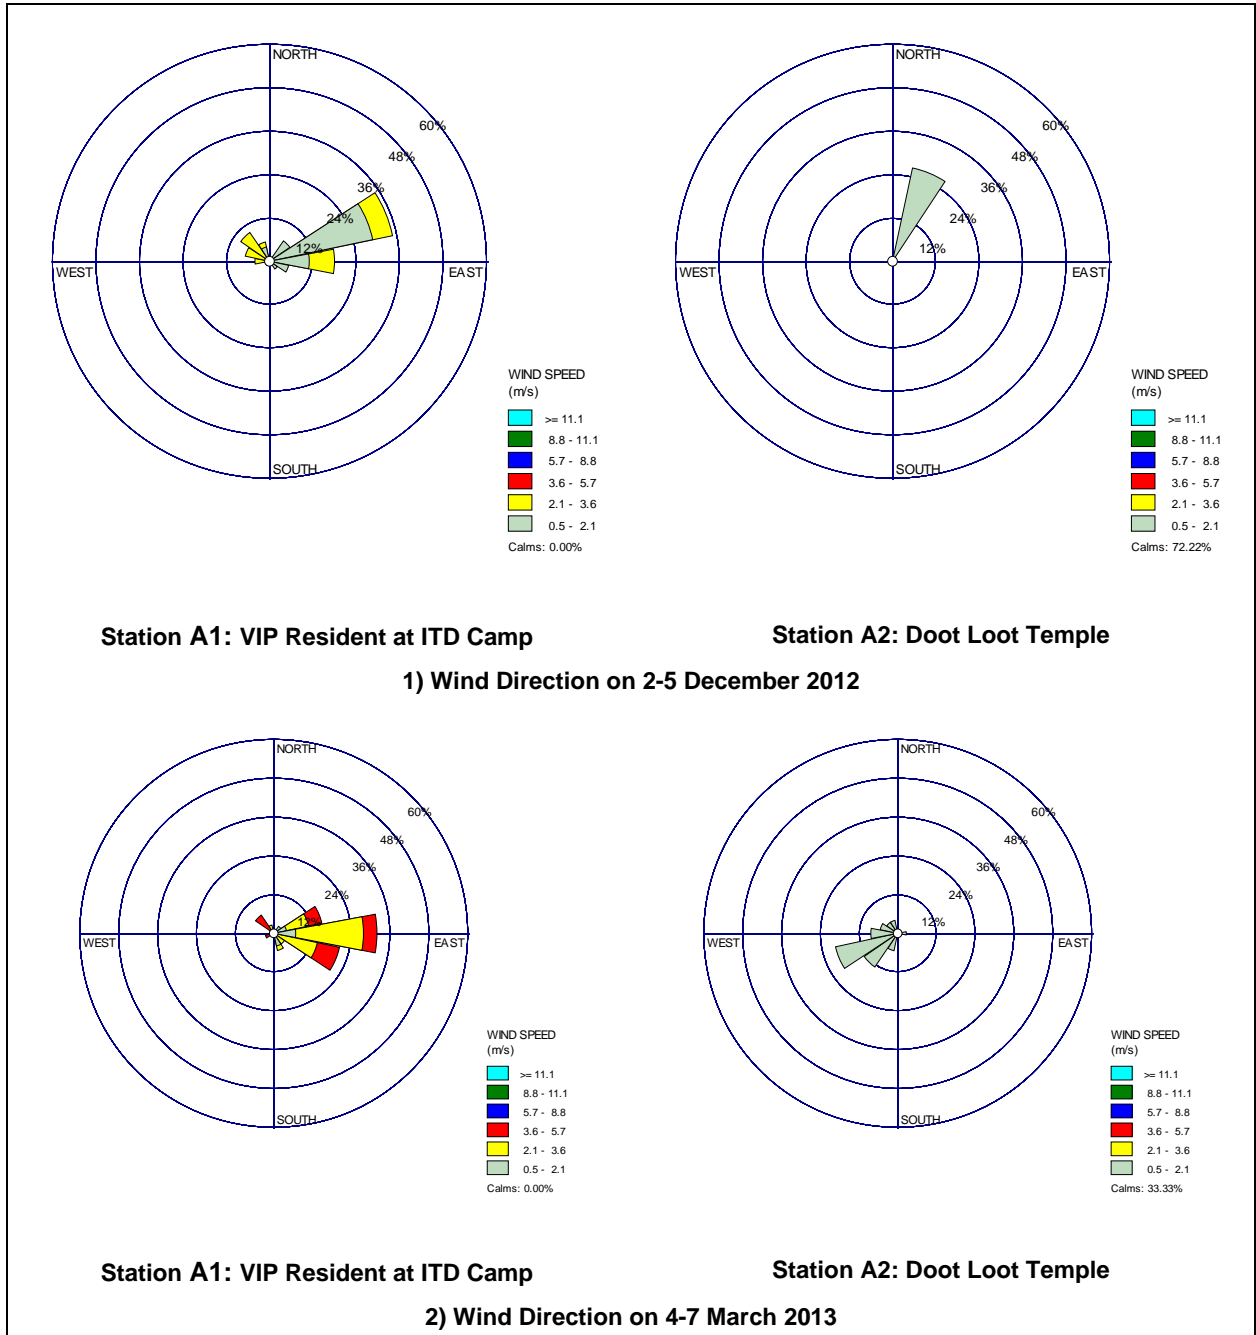

Figure 5.2-16 Wind Direction on 2-5 December 2012 and 4-7 March 2013

*Station A2: Doot Loot Temple (UTM (WGS84) 47P 413,446 E, 1,579,923 N)*

The air quality samplings were conducted on 2-5 December 2012 and 4-7 March 2013. Sampling locations of both sampling periods were slightly different. Due to construction activities with the wood shaving machine placed at the sampling area (Figure 5.2-17).

The concentrations of TSP (average 24 hours) were between 48-55  $\mu\text{g}/\text{m}^3$  and 77-194  $\mu\text{g}/\text{m}^3$ , particulate size less than 10 micron ( $\text{PM}_{10}$ ) (average 24 hour) were between 36-42  $\mu\text{g}/\text{m}^3$  and 54-106  $\mu\text{g}/\text{m}^3$ , for the first and second sampling respectively. Most results of particulate matter were not over standard except for  $\text{PM}_{10}$  from the second sampling which complied with the recommendations of the World Bank (World Bank, 1999) and U.S.EPA (U.S.EPA, 2011) but did not the recommendation of WHO (WHO, 2006). The major activity that may cause high  $\text{PM}_{10}$  during the second sampling was burning dry leaves and construction activities about 10-20 m nearby the sampling station. Also, wood shaving was observed during daytime of sampling period

The concentrations of  $\text{NO}_2$  (1 hour) from both sampling periods were between 0.0009-0.0068 ppm. and 0.0004-0.248 ppm., and the concentrations of CO (1 hour) were between 0.74-1.94 ppm. and 0.45-3.66 ppm., respectively. The concentration of  $\text{SO}_2$  (1 hour) from both sampling periods were between 0.0007-0.0035 ppm. and 0.0010-0.0248 ppm. and the respectively. The results of these parameters were within standards (Table 5.2-9). However, high levels of TSP,  $\text{PM}_{10}$ ,  $\text{NO}_2$  and CO were observed on the third day of second sampling period. These high levels may be caused by burning dry leaves in the garden closed to the sampling station on that day (Figure 5.2-18).

THC, MHC and NMHC were measured for preparation of baseline data even though no standards have been established (Table 5.2-10). However, the higher levels of THC and NMHC on the second sampling day of first sampling period could be caused by burning wooden charcoal in the kitchen nearby area.

As can be seen from the Table 5.2-11, the wind direction at station A2 from both sampling periods were predominantly came from North North East (NNE) and West South West (WSW), respectively. It is obvious that sampling area at station A2 is surrounded by very high betel trees, mostly much higher than the wind speed and direction pole.

Comparisons of air quality results between parameters measured in the previous studies and current study during the dry season indicated not much differences levels of TSP and  $\text{PM}_{10}$  (average 24 hours),  $\text{NO}_2$  (1 hour), and CO (1 hour). Several high levels observed during the current study were caused by specific activities at each location occurring only at the sampling period, not the usual activity in the area.

## 5.2.5 Noise and Vibration

### 5.2.5.1 Study Area

The study area covers the areas that may be affected the potential impact from project construction and operation. The nearest sensitive areas were selected to represent the existing condition of the study area

### 5.2.5.2 Baseline Noise and Vibration Conditions

#### *(a) Results from the Previous Surveys and Studies*

Noise and vibration measurements from relevant environmental studies are reviewed:

- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Final Report of Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013).
- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

Summary of methods and results from the previous studies are presented below.

Methodology

- There are four stations for noise measurement from the previous studies which are the same location as the air quality stations:
  - Station A3: The Construction Area (396,389 E, 1,577,260 N)
  - Station A4: The Guard House (399,444 E, 1,578,143 N)
  - Station A5: Km. 4+500 of Main Road (399,211 E, 1,578,342 N)
  - Station A6: Km. 18+900 of Main Road (412,483 E, 1,580,131 N)
- There are two stations for vibration measurement from the previous studies:
  - Station A5: Km. 4+500 of the Main Road (399,211 E, 1,578,342 N)
  - Station A6: Km. 18+900 of the Main Road (412,483 E, 1,580,131 N)
- The sampling stations are shown in Figure 5.2-19 .and the analysis methods and sampling period of each parameter are concluded in Table 5.2-12

Result of Studies

The collected noise measurements (Table 5.2-13) show that all of  $L_{Aeq}$  24 hours. and  $L_{Amax}$  data, both dry and wet seasons, are within the U. S. EPA. and Thai standards; however, the  $L_{Aeq}$  24 hours. In the Construction of Township and Km 18+ 900 of the Main Road ( A6) were higher than the other stations because these areas have many construction activities. The primary noise sources were from mobilization of the construction equipment.

The results of the study of vibration (Table 5.2-14) found that the Peak Particle Velocity of both stations, A5 and A6 did not affect any building more than 2.0 mm/s. The major sources of vibration were from trucks on the existing road.

**Table 5.2-12 Analysis Methods and Sampling Period of the Reviewed Noise and Vibration Level**

Parameter	Analysis method	Sampling period	Sampling date	Station

(b) Results from Baseline Monitoring

Baseline Monitoring Methodology

- Conduct noise level measurements during December 2012 (after monsoon season) and March 2013 (before monsoon season), which is the same period of air quality sampling. Two sampling stations are located at the same location as the air quality sampling stations (Figure 5.2-19):
  - Station A1: VIP Resident at ITD Camp (396,821 E, 1,576,646 N)
  - Station A2: Doot Loot Temple (413,446 E, 1,579,923N)
- Noise level parameters will include:  $L_{Aeq}$  1 hour,  $L_{Aeq}$  24 hours,  $L_{A90}$ ,  $L_{Amax}$ ,  $L_{Adn}$ ,  $L_{A5min}$ , and  $L_{A90}$  for nuisance noise. The sampling and analysis methods of those parameters are presented in Table 5.2-15.

**Table 5.2-15 The Sampling and Analysis Methods of Noise Level**

Parameters	Method	Sampling Station
$L_{Aeq}$ 1 hour, 24 hours, $L_{A90}$ , $L_{max}$ , $L_{Adn}$ $L_{A5min}$ , $L_{A90}$ for nuisance noise	Integrated Sound Level (International Electrotechnical Commission ; IEC 61672-1, 61672-2)	N5-N6

Measuring procedures were performed to comply with IEC 61672-1 Standard. The measurement of 1 hour noise average level is an average noise level generating from noise sources both natural and other activities, continuously for 1 hour.  $L_{Amax}$  is the highest noise level in 1 hour occurring by natural such as thunder and thunderbolt or other activities such as gun-shooting and metal cracking or explosive sounds. Measured  $L_{Aeq}$  1 hour can be computed for  $L_{Aeq}$  24 hours and can be compared to the Community Noise Standard of 70 dB(A) and 115 dB(A) for  $L_{Amax}$ . All raw data of  $L_{Aeq}$  1 hour can be computed for  $L_{Adn}$ . Nuisance noise level as  $L_{An}$  ( $n = 5, 10, 50, 90$  and  $95$ ) can be recorded by sound level meter for characteristic noise consideration such as  $L_{A5}$  or  $L_{A10}$  is nuisance noise while  $L_{A90}$  or  $L_{A95}$  is background noise.

Noise measurement for  $L_{Aeq}$  24 hours was conducted by using an integrated sound level meter with 0.5 inch diameter condenser microphone and weighting network. Specifications of the meters are complied with the IEC 651 and IEC 804 (IEC 61672-1) standards. The meters are made in RION, model NL-21, product of Japan. Calibration will be done on site by tuning with a RION, NC-73, standard sound level generator. The calibrator generates 1000 Hz, 94 dB as a standard noise source. The meters were installed on a tripod of about 1.2-1.5 meter height above ground.

For annoyance noise level, it was measured by using an integrated sound level meter Model NL-21 of RION Co., Ltd., Japan. This meter is complied with IEC 651 and 804 (IEC 61672) standards. The noise level measuring is an integrated sound level meter with a 0.5 inch diameter condenser microphone and weighting network. The meters were installed on a tripod of about 1.2- 1.5 meter height above ground and radius within 3.5 meter that was calibrated at site with sound level calibrator at standard noise level of 94 dB(A) and frequency of 1,000 Hz.

Annoyance noise level monitoring was conducted according to Thailand Annoyance Noise Level Standard by measuring noise level while annoyance occurred at the meter installation area in 1 hr, measuring background noise level (not less than 5 minutes), and recording  $L_{A90}$ . After that, the annoyance noise level was calculated following the notification of the Pollution Control Board, 2007.

### Ambient Noise Baseline Monitoring Results

#### *Station A1: VIP Resident at ITD Camp (UTM (WGS84) 47P 396,821 E, 1,576,646 N)*

As the result of ambient noise monitoring during 2-5 December 2012 and 4-7 March 2013 found that  $L_{Aeq}$  1 hour were between 49.5-61.7 dB(A) and 45.1-54.9 dB(A),  $L_{Aeq}$  24 hours were between and 53.2-54.9 and 50.4-50.5 dB(A),  $L_{Amax}$  were between 65.5-91.4 and 59.4-80.7 dB(A), and  $L_{Adn}$ , were between 58.6-58.8 and 55.1-55.7 dB(A), respectively. In additional  $L_{A90}$  were between 45.4-54.2 and 40.0-47.1 dB(A). All the noise levels were within the U.S.EPA. standard (Table 5.2-16). The ambient noise levels from the second sampling are slightly lower than the first sampling.

Comparing the results with the previous measurement at station A3, the ambient noise levels from the baseline monitorings are lower than the previous studies, possibly due to completion of construction activities surrounding the stations.

The annoyance noise measured on 3 March 2013 was 10.6 dB(A) exceeding the proposed standard (Table 5.2-17). Primary noise sources at this station were from road transportation nearby the sampling station and from the construction activity closed to the sampling area.

Figure 5.2-19 Ambient Noise Level Measuring in December 2012 and March 2013

Station A2: Doot Loot Temple

Figure 5.2-19 Ambient Noise Level Measuring in December 2012 and March 2013 (Cont.)

*Station A2: Doot Loot Temple (UTM (WGS84) 47P 413,446 E, 1,579,923 N)*

As the result of ambient noise monitoring during 2-5 December 2012 and 4-7 March 2013 found that  $L_{Aeq\ 1\ hour}$  were between 44.4-53.5 and 44.6-61.8 dB(A),  $L_{Aeq\ 24\ hours}$  were between 47.9-49.1 and 54.1-55.4 dB(A),  $L_{Amax}$  were between 54.5-78.3 and 55.0-89.3 dB(A),  $L_{Adn}$  were between 52.4-53.1 and 56.4-59.0 dB(A), respectively. In additional  $L_{A90}$  were between 40.0-46.1 and 41.5-53.0 dB(A). The noise level was within the US.EPA. standard. The ambient noise levels from the second sampling period are higher than the first sampling period possibly due to wood shaving activity occurred during daytime near the sampling station (Table 5.2-16).

Baseline noise level at station A2 was higher than the previous studies at the nearby station A6 due to the ongoing construction activities near the station.

The annoyance noise measured on 3 March 2013 was 10.2 dB(A) exceeding the proposed standard (Table 5.2-17) most likely due to the said construction activities in the vicinity.

## 5.2.6 Groundwater Quality

### 5.2.6.1 Study Area

Groundwater is a major source of water supply in the adjacent area as well as project construction activities. The study area of groundwater will cover the area potentially affected by project development to the proposed solid waste storage area and other nearby locations.

### 5.2.6.2 Baseline Groundwater Conditions

#### (a) Results from the Previous Surveys and Studies

##### Sources of Information

Groundwater quality measurements from relevant environmental studies:

- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

#### (b) Methodology

- There are nine stations of ground water quality measurement from the previous studies: (Figure 5.2-20)
  - Station GW1: Mudu Village (401,595 E, 1,576,398 N)
  - Station GW2: Tha Byae (403,463 E, 1,570,628 N)
  - Station GW3: Lae Shaung (398,172 E, 1,580,028 N)
  - Station GW4: Mayin Gyi (394,283 E, 1,579,704 N)
  - Station GW5: Pan Tin In (403,332 E, 1,565,791 N)
  - Station GW6: Twain Gyi (398,821 E, 1,579,916 N)
  - Station GW7: Mudu Village (401,551 E, 1,576,749 N)
  - Station GW8: Pa Ya Dat Village (396,794 E, 1,581,009 N)
  - Station GW9: Pan Din In Village (403,329 E, 1,566,970 N)
- The sampling stations are shown in Figure 5.2-20. The analysis methods and sampling period of each parameter are concluded in Table 5.2-18.

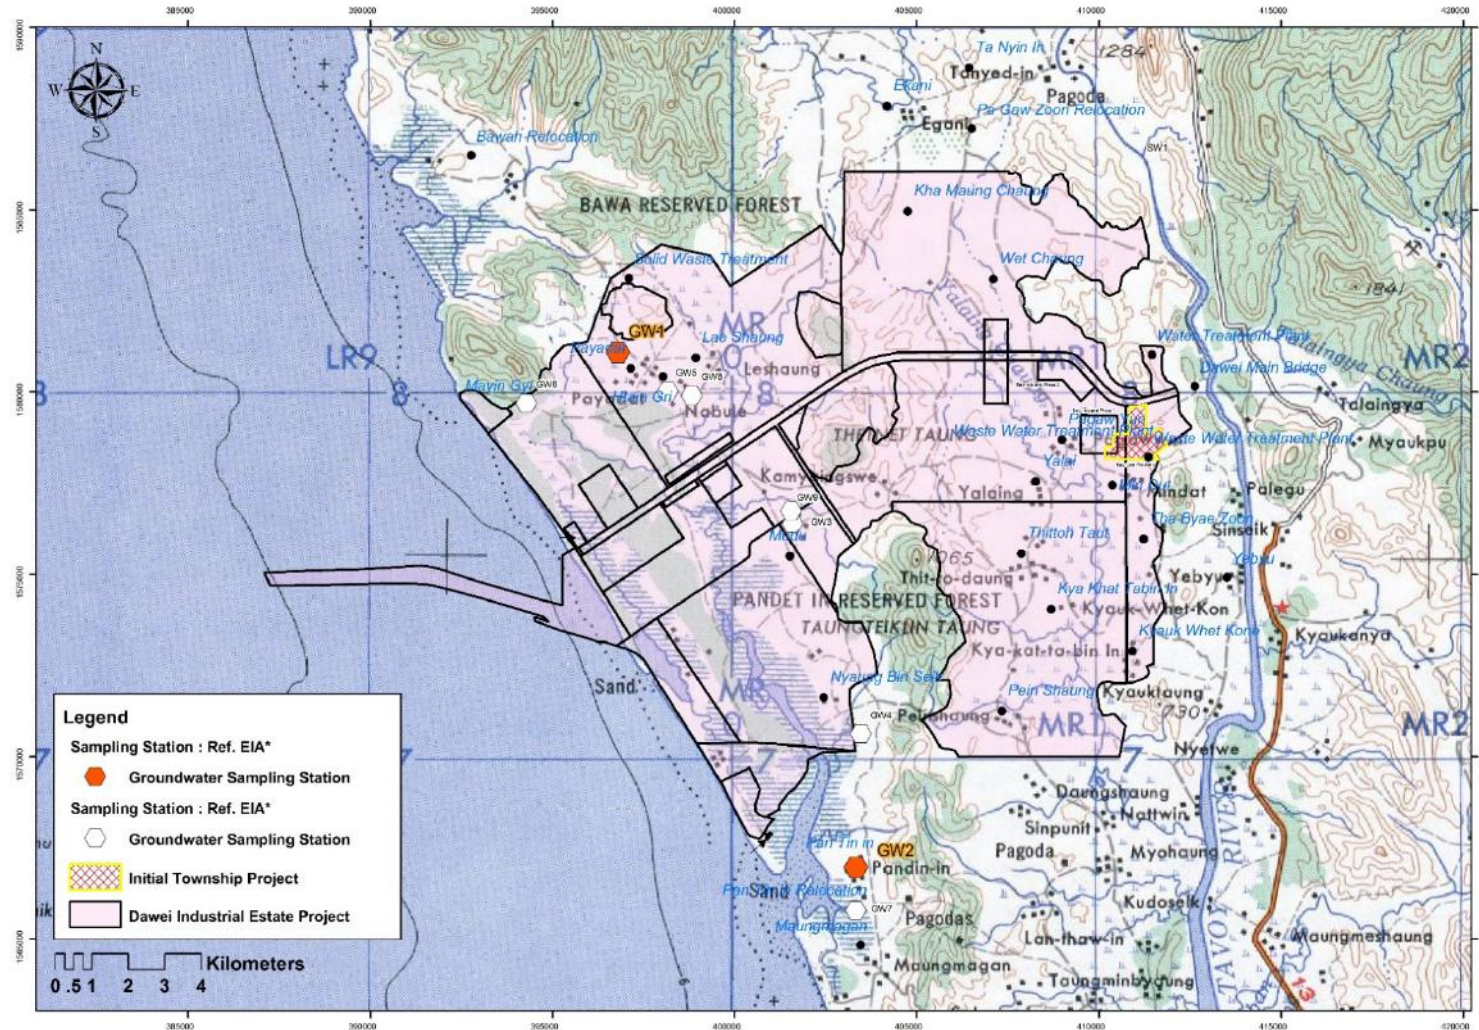

Figure 5.2-20 Reviewed Groundwater Quality Measurement Stations Compared with Stations of this EIA Study

### Result of Studies

All pH results showed that groundwater in this area are acidic, (Table 5.3-19) which were below the standard and not comply with it. Acidity occurs from carbon dioxide dissolved in water. The pH is 4 - 8.5. Normally, water in nature consists of carbon dioxide. High carbon dioxide may be in groundwater because of biodegradable (data from the Water Reuse Center from [http://www.softwarethai.co.th/waterreusecenter/index.php?option=com\\_content&view=article&id=99%3A2013-06-17-06-18-44&catid=14%3Agis&Itemid=21](http://www.softwarethai.co.th/waterreusecenter/index.php?option=com_content&view=article&id=99%3A2013-06-17-06-18-44&catid=14%3Agis&Itemid=21)).

Manganese can be found in groundwater or deep water in lakes or reservoirs as well as in soil and rock. It is usually found in combination with the other elements to form different minerals (<http://www.stou.ac.th/>).

Cadmium results at GW1-GW5 were exceeding the standard. Cadmium is a natural, usually minor constituent of surface and groundwater. It may exist in water as the hydrated ion, as inorganic complexes such as carbonates, hydroxides, chlorides or sulphates, or as organic complexes with humic acids ([http://www.cadmium.org/pg\\_n.php?id\\_menu=6](http://www.cadmium.org/pg_n.php?id_menu=6)).

Total Coliform Bacteria of some sampling stations were also detected high. Nevertheless, local people normally use well water for consumption but they will boil before drinking.

(c) Results from Baseline Monitoring

Baseline Monitoring Methodology

- Conduct groundwater quality sampling on 2 and 14 March 2015. The surface water quality was collected and analyzed at two sampling stations:
  - GW1: IE-BH01 (409068 E, 1581846 N)
  - GW2: IE-BH02 (408996 E, 1581827 N)
- The sampling locations are shown in Figure 5.2-21.
- The groundwater quality parameters and analysis methods of those parameters are presented in Table 5.2-20.

**Table 5.2-20 Groundwater Quality Parameters in March 2015**

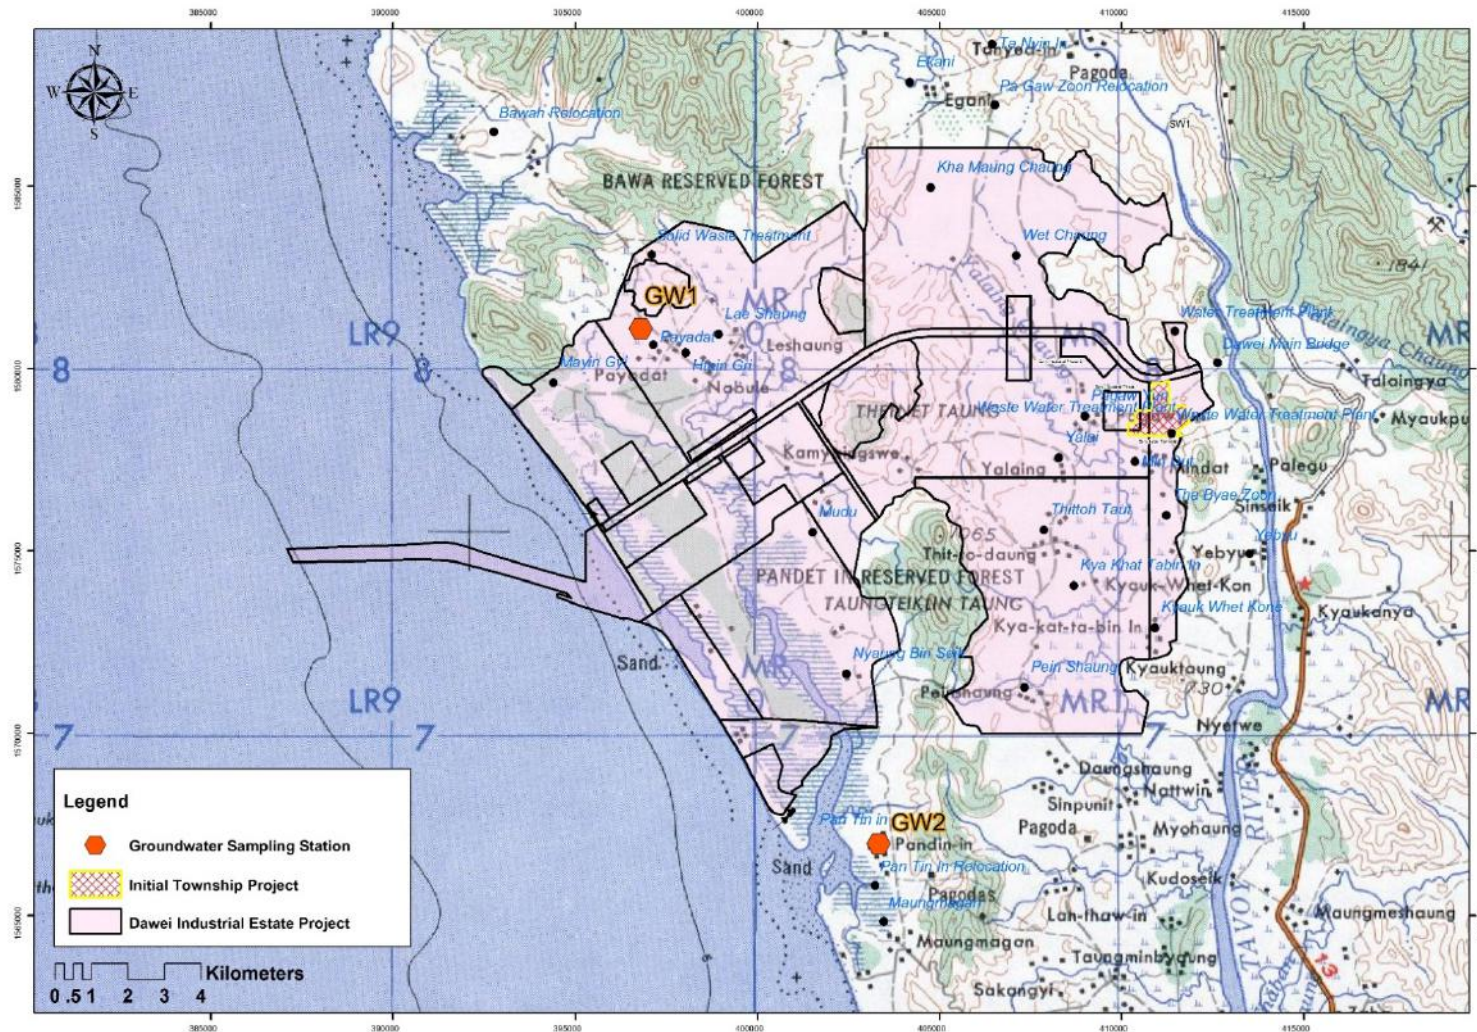

Figure 5.2-21 Groundwater Sampling Stations

Groundwater samples were grabbed by bailer (Figure 5.2-22) and kept in the sampler before being transferred in each bottle. Some physical parameters such as pH, conductivity and water color were measured and observed on site. To protect any contamination during sampling, sampling sequence began from E. coli bacteria sampling by sterile technique, followed by heavy metals sampling for mercury (Hg) and other heavy metals, total hardness and non-carbonate hardness. All collected sample bottles were labeled and information was recorded in a chain of custody. All samples were kept in cooling box and shipped back to UAE laboratory within recommended holding time.

GW2 : IE – BH 02

Figure 5.2-22 Groundwater Sampling

### Groundwater Baseline Monitoring Results

Groundwater sampling was conducted on 2 and 14 March 2015 from 2 sampling stations (Table 5.2-21 and **Annex 5-1** Groundwater Analysis Report). From both sampling results, all complied with standard excepting lead. Lead is one of the elements in nature. It can be found in water as well as in soil, rock and air. It is usually found in combination with the other elements to form different minerals (<http://www.yale.edu> and <http://webdb.dmasc.moph.go.th>). TCB and E. Coli were also detected low. Nevertheless, local people normally use well water for consumption but they will boil before drinking.

Comparison of previous and monitoring studies indicated that groundwater quality were quite similar.

## 5.2.7 Surface Water and Sediment

### 5.2.7.1 Study Area

The possible adverse effects that a developing project may have on the quality of the surface water need to be determined prior to the implementation of the project. After reviewing the master plan, the project will discharge treated wastewater from wastewater treatment plants to Dawei and Kunchuang River. Therefore, the study area will cover both upstream and downstream of the proposed discharge points as well as the proposed discharge points.

### 5.2.7.2 Baseline Surface Water and Sediment Conditions

#### (a) Results from the Previous Surveys and Studies

The main source of Information relevant to surface water and sediment quality relevant to the Initial Township is:

- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

Summary of the results of the previous study is summarized below.

#### Methodology

- There are fifteen stations for surface water and sediment quality measurement during March 2012 (dry season) and May 2012 (wet season) and during December 2012 (after monsoon season) and March 2013 (before monsoon season):

- 1) During March 2012 (dry season) and May 2012 (wet season);
    - Station SW1: Dawei River (412,709 E, 1,582,539 N)
    - Station SW2: Dawei River (412,715 E, 1,579,831 N)
    - Station SW3: Canal at KM 3+000 (398,804 E, 1,577,888 N)
    - Station SW4: Canal at KM 12+000 (406,344 E, 1,581,074 N)
  
  - 2) During December 2012 (after monsoon season) and March 2013 (before monsoon season);
    - Station SW5: Dawei River (411,076 E, 1,586,240 N)
    - Station SW6: Dawei River at Yeburu (413,746 E, 1,575,083 N)
    - Station SW7: Canal (412,629 E, 1,568,345 N)
    - Station SW8: Canal (412,646 E, 1,567,332 N)
    - Station SW9: Dawei River about 500 m downstream from SW8 (412,605 E, 1,566,856 N)
    - Station SW10: Dawei River, about 1,000 m downstream from SW9 (412,272 E, 1,565,906 N)
    - Station SW11: Dawei River, about 1,000 m downstream from SW10 (412,418 E, 1,564,897 N)
    - Station SW12: Dawei River, about 1,000 m downstream from SW11 (412,514 E, 1,563,905 N)
    - Station SW13: Dawei River, about 2,000 m downstream from the bridge crossing Dawei River at Dawei City (412,213 E, 1,553,337 N)
    - Station SW14: Kunchuang River (409,524 E, 1,570,309 N)
    - Station SW15: Kunchuang River, about 500 m before flowing to Dawei River (412,064 E, 1,568,062 N)
- The surface water sampling of those stations was conducted during March 2012 (dry season) and May 2012 (wet season) and during December 2012 (after monsoon season) and March 2013 (before monsoon season). Surface water was collected via the grab sampling method. Water sample preservation methods are conducted to the Standard Methods for the Examination of Water and Wastewater by American Public Health Association. The sampling stations are shown in Figure 5.2-23.
  - The sediment sampling of those stations was conducted during March 2012 (dry season) and SW5-SW13 was conducted only. The sediment was collected by a sediment grab. The sampling stations are shown in Figure 5.2-23.
  - The analysis methods of each parameter are concluded in Table 5.2-22.

### Results of the Previous Studies

Overall results of surface water quality measurement during the dry season (SW1-SW4) were not significantly different from the wet season excepting turbidity, total solids, and COD that were a bit different between the seasons. The concentration of water quality for the two stations in Dawei River were almost always higher than the canal, especially considering total solids, COD, and TKN (Table 5.2-23). The results of COD in some stations were unusually high (5,929 and 96,595 mg./L.), while the BOD at the same stations were not escalated compared with other stations. This was most likely a result of high turbidity and solids in samples rather than contamination of organic pollutions in the water.

Sampling stations of surface water (SW1 and SW2 in Table 5.2-23) covered a more extended reach of Dawei River as the representative of upstream sampling. Moreover, two sampling stations (SW3 and SW4) in Kunchaung River of which wastewater from the project area might be disposed were included in the baseline monitoring.

The surface water sampling was conducted in December 2012 Table 5.2-23 along Dawei River (SW5-SW13) and Kunchaung River (SW14-SW15). In Dawei River, most of parameters complied with the proposed surface water standard excepting phenol at SW5-SW12 and manganese at SW13. In Kunchaung River, most of the parameters complied with the proposed standard excepting phenol at both SW14 and SW15.

At SW13, the manganese concentration (2.08 mg/L) was Higher than the standard limit (<1.0 mg/L). The manganese level is commonly low in natural surface water but the source of manganese in the area is possibly from domestic wastewater discharge, industrial waste (iron, steel, acid mine drainage), as well as use of pesticides in the vicinity of Dawei City.

Most of phenol monitoring results in Table 5.2-24 excepting station SW13 was greater than the standard limit ( $\leq 0.005$  mg/L). Causes may be from a property of phenol and phenol use in various industries. A claimed property of phenol is that phenol can be dissolved in water as well (<http://www.siamchemi.com/>).

Upstream of the project along Dawei River at SW5, total solids content was rather low, which increased towards downstream especially at SW13 which was close to Dawei City. A similar changes were observed in other parameters such as coliform (TCB, FCB and E.Coli), nitrate- nitrogen, TKN, zinc, cadmium and iron. However, these parameters were still in compliance with the proposed standard (Table 5.2-24).

The surface water sampling was conducted in March 2013 at the same stations along Dawei River (SW1-SW9) and Kunchaung River (SW14-SW15). Water appeared to be very turbid with much higher level of total solids (about 5 to 20 times higher) than that of the sampling in December 2012. Salinity levels were noticeable in most sampling stations excepting SW5 and SW6. For both Dawei River and Kunchaung River, several parameters were not in compliance with the proposed standard, namely: BOD, ammonia- nitrogen, phenols, manganese, and some heavy metals in certain stations (Table 5.2-25). Phenols were also detected in many stations but at lower levels than the sampling in December 2012. Moreover, at SW6, the highest total solids and turbidity were observed with some heavy metals (zinc, copper, lead and nickel) were slightly higher than the standard, possibly due to turbidity of water and/or associated resuspended sediments. Heavy metals were often influenced by sediment.

The results of sediment monitoring show that the physical character of the sediment at SW1 and SW3 was mostly sand, while the sediment at SW2 and SW4 was mixed with equal portions of sand, silt, and clay. The quality of the sediment samples found that almost all samples in Dawei River had less concentration of sediment than the samples in the canal within the project area in this previous measurement, especially heavy metal; however, all analyzed data were well within sediment quality guidelines.

Remark <sup>1/</sup> Thailand Surface Water Quality Standard, Class 3

\* The result did not comply with standard

Another previous sediment measurement in Dawei River was also sampled in December 2012 and March 2013. Physical characteristics of sediment in Dawei River from SW5 to SW11 indicated that the sediments of both sampling period were mostly clay (52.1-66.4% and 55.3-68.9%, respectively). But the sediments of SW12 from the both samplings were different: mostly clay (58.9%) and sand (38.4%) during the sampling in December 2012 and combination of sand (43.8%), clay (32.2%) and silt (20.0%) during the sampling in March 2013. For SW13, the sediment was mostly sand from both sampling periods (58.3, and 74.9%, respectively), with a composition of more sand and hardly any clay (0%) from the sampling in March 2013. The different physical compositions of sediment from SW13 were probably due to river bank erosion and port activities as observed in the area (Figure 5.2-24)

**Figure 5.2-24 SW13: River Bank Erosion and Small Port Activity**

Chemical characteristics of sediments from both sampling events in December 2012 and March 2013 from upstream to downstream are variable. The levels of each parameter tended to be lower at downstream location. Noted that most of heavy metal concentrations detected in sediment were arsenic, zinc, copper, iron, lead, nickel and total chromium, but all results were far below the proposed sediment quality guideline (Table 5.2-26 and Table 5.2-28).

In comparison with Dawei River sediments results from the previous study excepting SW13, the physical characteristics were similar. Heavy metals have been found in previous and current studies with similar variations for iron, nickel, lead levels. However, in this study the levels of arsenic (0.139-3.01 mg/kg) and zinc (5.51-62.4 mg/kg) were much higher than the concentrations found in previous study (<0.005 mg/kg for arsenic and 8.46-8.51 mg/kg for zinc).

*(b) Results from Baseline Monitoring*

Baseline Monitoring Methodology

- Conduct surface water quality and sediment sampling during 27 February 2015 and 23 March 2015. The surface water and sediment quality will be collected and analyzed at 6 sampling stations. The sampling locations are shown in Table 5.2-29 and Figure 5.2-25.

The surface water quality parameters and analysis methods of those parameters are presented in Table 5.2-30.

### *Surface Water Sampling Method*

Surface water sampling method is complied with the Standard Methods for the Examination of Water and Wastewater (APHA, AWWA, and WEF, 2012) (Figure 5.2-26). Surface water sampling was performed by grab sampling method at mid-depth level of the middle width of river excepting fat, oil and grease samples, using surface grab sampling, and TCB and FCB which were collected at 30 cm under water surface. Some physical parameters including water depth, pH, water temperature, electrical conductivity and salinity and flow rate were measured at site by depth meter, electric pH meter, thermometer, conductivity meter and flow meter, respectively. All portable meters were calibrated at the sampling site before measuring.

To protect any contamination at site during sampling, scientists has to wear flour free rubber gloves. Mercury (Hg) samples were collected in Pyrex glass (Teflon Cap) and samples for other heavy metals were collected in polyethylene bottle. Samples for suspended solids and biochemical oxygen demand were collected in the same polyethylene bottle. Fat, oil and grease samples were separately collected at surface level by glass bottle.

All samples were specifically preserved. Labels were attached, all sample information were recorded in field log book and chain of custody and all bottles were kept in cool conditions before shipping to UAE Laboratory for analysis within recommended holding times.

### *Sediment Sampling Method*

Sediment samples were collected by using Peterson Dredge Sampler ( Figure 5.2-27). The position of all sampling locations determined at the time the grab sampler contacts the bottom using handheld GPS. All locations recorded as latitude and longitude based on the World Geodetic System (WGS) Datum of 1984.

Samples for chemical and physical analyses were collected from the top 2 cm. of each sediment sample. Sediment samples were then kept cool immediately after collection, and shipped to the UAE laboratory for analysis.

### *Surface Water Sampling Method*

Surface water sampling method is complied with the Standard Methods for the Examination of Water and Wastewater (APHA, AWWA, and WEF, 2012) (Figure 5.2-26). Surface water sampling was performed by grab sampling method at mid-depth level of the middle width of river excepting fat, oil and grease samples, using surface grab sampling, and TCB and FCB which were collected at 30 cm under water surface. Some physical parameters including water depth, pH, water temperature, electrical conductivity and salinity and flow rate were measured at site by depth meter, electric pH meter, thermometer, conductivity meter and flow meter, respectively. All portable meters were calibrated at the sampling site before measuring.

To protect any contamination at site during sampling, scientists has to wear flour free rubber gloves. Mercury (Hg) samples were collected in Pyrex glass (Teflon Cap) and samples for other heavy metals were collected in polyethylene bottle. Samples for suspended solids and biochemical oxygen demand were collected in the same polyethylene bottle. Fat, oil and grease samples were separately collected at surface level by glass bottle.

All samples were specifically preserved. Labels were attached, all sample information were recorded in field log book and chain of custody and all bottles were kept in cool conditions before shipping to UAE Laboratory for analysis within recommended holding times.

### *Sediment Sampling Method*

Sediment samples were collected by using Petersen Dredge Sampler ( Figure 5.2-27). The position of all sampling locations determined at the time the grab sampler contacts the bottom using handheld GPS. All locations recorded as latitude and longitude based on the World Geodetic System (WGS) Datum of 1984.

Samples for chemical and physical analyses were collected from the top 2 cm. of each sediment sample. Sediment samples were then kept cool immediately after collection, and shipped to the UAE laboratory for analysis.

### Surface Water and Sediment Baseline Monitoring Results

Sampling stations of surface water in this study covered the Dawei River from upstream to downstream of the project boundary. The surface water sampling was conducted on 27 February 2015 along Dawei River. Most of parameters complied with the proposed surface water standard; excepting DO at TS-SW1, BOD at TS-SW1 and TS-SW2, phenol at TS-SW1 and TS-SW5, arsenic, manganese and lead at TS-SW4 - TS-SW6, mercury at TS-SW1 and TS-SW4 - TS-SW5, nickel at TS-SW5 and TS-SW6 and TCB and FCB at TS-SW2 and TS-SW3 (Table 5.2-31) and **Annex 5-2** Surface water Quality and Sediment Analysis Report).

The DO and BOD at TS-SW1 and TS-SW2 did not comply with such standard which may be possibly from animal husbandry.

Various types of industries: oil, coal, metallurgic, chemical production, explosive, dyes, palm oil mill as well as textile, and also degradation of pesticides, and/or natural occurrence may cause phenol contaminations in the surface water (Michalowies and Duda, 2007). In side of heavy metal measurement such as manganese and nickel were higher than such standard; it may be possibly due to similar sampling season with previous sampling in dry season in 2012 and in 2015.

Majority of water contamination from bacteria in forms of total coliform and fecal coliform is from local activities such as domestic wastewater discharge and animal husbandry.

Sediment quality in Dawei River was also sampled on 27 February 2013. Chemical characteristic of sediment in Dawei River from TS-SW1 to TS-SW6 indicated that chemical characteristics from upstream and downstream were variable (Table 5.2-31). Most of parameters complied with the proposed surface water standard; excepting mercury in every sampling station. With the exception of mercury ore deposits, the amount of mercury that naturally exists in any one place is usually very low. In contrast, the amount of mercury that may be found in soil at a particular hazardous waste site because of human activity can be high (over 200,000 times natural levels) (Public Health Statement (MERCURY), Agency for Toxic Substances and Disease Registry, 1999) (Table 5.2-32).

## 5.3 BIOLOGICAL COMPONENTS

### 5.3.1 Surface Water Biology (Aquatic Ecology and Fisheries Activities)

#### 5.3.1.1 Study Area

The possible adverse effects of a developing project on the surface water biology have to be determined prior to the implementation of the project. After reviewing the master plan, the project will discharge treated wastewater from wastewater treatment plant.

The wastewater treatment plant will discharge treated wastewater to small canal and will run through Dawei River. Therefore, the study area will cover the upstream and downstream of the proposed discharge point.

#### 5.3.1.2 Baseline Surface Water Biology

##### Results from Previous Survey and Studies

The previous studies in the project area that can be referenced to include:

- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

The baseline conditions of the surface water biology from the previous study are summarized below.

##### Plankton

In December 2012, 50 species of phytoplankton were found. Diatom was the dominant taxa, of which *Thalassiosira*, *Coscinodiscus*, *Synedra*, *Pleurosigma* and *Surirella* were the most abundant. The total abundance of phytoplankton ranged between 1,482,876 to 9,837,697 units/cu.m. and diversity index of phytoplankton ranged between 1.032 to 2.45.

Twenty- one species of zooplankton were identified. Tintinnopsis and Arcella (protozoan) were the most abundantly found in all stations. The total abundance of zooplankton ranged between 9,204 to 94,832 units/cu. m. ,and diversity species index of zooplankton ranged between 0.849 to 2.017.

In March 2013, 36 species of phytoplankton were found. Diatom was the dominant taxa, of which *Thalassiosira*, *Coscinodiscus*, *Synedra*, *Pleurosigma* and *Surirella* were the most abundant, similar to December 2012, the total abundance of phytoplankton were between 571,999 to 53,200,535 units/cu.m., and diversity species index of phytoplankton were between 0.881 to 1.730.

9 species of zooplankton were identified. Nauplius of Copepod and Arcella (protozoan) were the most abundantly found. The total abundance of zooplankton was between 24,267 to 545,867 units/ cu. m. and diversity species index of zooplankton ranged between 0.000 to 1.565.

As indicated by Wilhm and Dorris (1968), the diversity index (H') is related to surface water quality. In December 2012 the average diversity index was 1.918, while in March 2013, the average index was 1.255. Both diversity index results imply that during these two sampling

periods the water quality of Dawei River were at moderate conditions and acceptable for aquatic organisms.

### Benthos

In December 2012, 8 species of benthos were found. of which segmented worms were dominant in all stations. The total density of benthos ranged between 0 to 45 individuals/sq.m.

In March 2013, 6 species of benthos were found of which segmented worms were dominant in all sampling stations, The total density of benthos were between 0 to 70 individuals/sq.m.

### Littoral Fauna

In December 2012, 6 families of littoral fauna were found, of which freshwater shrimp was dominant. The total density of littoral fauna was between 3 to 12 individuals/sq.m.

In March 2013, 3 families of littoral fauna were found, of which freshwater shrimp was also dominant. The total density of littoral fauna was between 2 to 9 individuals/sq.m.

### Aquatic Flora

Aquatic flora samples were collected during in December 2012 and March 2013. A total of 13 species of aquatic flora were found in both sampling periods. *Actinoscirpus grossus* (coarse bulrush) were dominant in freshwater zone station *Acanthus ebracteatus* (sea holly) and *Nypa fruticans* (nipa palm) were dominant in tidal zone station.

### Fish

In December 2012, 25 fish species were found, of which Goby (Gobiidae) was dominant. The total density of fish were between 750 and 13,800 individuals/hectare, and the total abundance of fishes were between 4.036 and 58.6 kg./hectare.

In March 2013, total of 15 fish species were found, of which Goby (Gobiidae) was also dominant. The total density of fish were between 400 to 2,850 individuals/hectare, and the total abundance of fish were between 0.708 to 29.763 kg./hectare.

Total of 28 freshwater and brackish fish species were found, with more brackish species found in the second sampling survey. The heaviest fishes found in both sampling periods consist of Needle fish, Goby, Paradise fish, Croaker, Barramundi (White seabass) and Snakehead.

## **Fisheries Activities**

### Fisheries Activities in Dawei River

Two pushnet boats and two set bag nets were used as the fishing gear by the fishermen during both sampling survey. Moreover, gillnet and lined hook are small fishing gear also being used to catch fishes for household consumption.

Results from Baseline Monitoring

*Baseline Monitoring Methodology*

27 February 2015 and 23 March 2015. The phytoplankton, zooplankton, benthic fauna, littoral fauna, aquatic flora and fishes were collected and analyzed at 6 sampling stations. The sampling locations are shown in Table 5.3-1 and Figure 5.3-1 to Figure 5.3-2

The surface water biology parameters and analysis methods of those parameters are summarized in Table 5.3-2.

**Table 5.3-1 Summary Locations of Surface Water Biology Monitoring Stations**

Environmental Monitoring	GPS		
	UTM WGS 84	East (X)	North (Y)
TS-SW1 : Discharge Point at the North of the Project	47P	412177	1579948
TS-SW2 : Upstream At Yalai Chaung Conference of Yalai Chaung and Canal (that Receiving Wastewater from Discharge Point at the South of the Project)	47P	409343	1571341
TS-SW3: Downstream at Yalai Chaung Conference of Yalai Chaung and Canal (that Receiving Wastewater from Discharge Point at the South of the Project)	47P	409827	1568570
TS-SW4: Dawei River (at the Boundary of the Project Area, Ta Nyin In Village)	47P	408665	1589930
TS-SW5: Dawei River (about 500 m Upstream from the Yang Gaeng Bridge)	47P	412694	1580700
TS-SW6: Dawei River (about 500 m Downstream from the Yang Gaeng Bridge)	47P	412866	1579580

**Table 5.3-2 Sampling Methodology of Surface Water Biology Parameters**

Parameters	Method <sup>1/</sup>	Sampling Station
Fishes	Collected by Seining. All samples were separated and preserved in 10 % formalin solution and brought back to UAE Laboratory for identification (Figure 5.3-1)	TS-SW1: Discharge Point at the North of the Project
Plankton	Both 21 and 70 micron mesh size. Plankton nets were used to collect phytoplankton and zooplankton samples respectively at each sampling location. In case the river is very shallow, 30 liters of water at about 30 cm. below the surface will be poured through the plankton net. Plankton sample remaining in the net was transferred and kept in a plastic bottle and preserved in 5% formalin solution and brought back to the UAE laboratory for species identification and abundance estimate (Figure 5.3-2)	TS-SW2: Upstream at Yalai Chaung Conference of Yalai Chaung and Canal (that Receiving Wastewater from Discharge Point at the South of the Project) TS-SW3: Downstream at Yalai Chaung Conference of Yalai Chaung and Canal (that Receiving Wastewater from Discharge Point at the South of the Project)
Benthos	A Petersen dredge of 0.25 sq.ft mouth opening was used to collect benthic fauna. Three grab samples were collected at each sampling station. Collected sediment was observed, then washed and sorted through a series of wire sieves. All samples collected were kept in plastic bottle and preserved in 5% formalin solution and brought back to the UAE laboratory for their group identification and number estimate (Figure 5.3-3)	TS-SW4: Dawei River (at the Boundary of the Project Area, Ta Nyin In Village) TS-SW5: Dawei River (about 500 m Upstream from the Yang Gaeng Bridge)
Littoral Fauna	A sweep-net method (D-frame net with 30 cm x 20 cm opening) was used to collect the aquatic fauna. The collector stood in the river about 1.5 m from the water's edge. Working in an upstream direction, the net was swept 10 times near the substratum surface (for one sample) while moving forward. Each sweep is about 1 m at right angles to the bank and in water between 1 and 1.5 m. depth.  All substrata were collected. The net contents were washed to the bottom of the net, the net was inverted, and the contents were emptied into a bucket, rinsing off any material remaining on the net and empty the bucket to a 0.5 mm mesh sieve. The contents of the sieve were placed in a sorting tray, adhering material was rinsed off with clean water, and the sample was dispersed in the water. Any animals clinging to the net were picked off and added to the tray. All animals were removed from the sorting tray in the field using forceps and pipettes, and placed into plastic jars containing 70% alcohol. The sample jars were labeled with site name, location code, date, and replicate number then shipped back to the laboratory for specie identification. (Figure 5.3-4)	TS-SW6: Dawei River (about 500 m Downstream from the Yang Gaeng Bridge)
Aquatic Flora	Around each sampling station , aquatic flora were observed and recorded its density was roughly estimated as followed: Abundance (or xxx): occupies 66.67-100.00% in about 500 sq.m. area. Moderate (or xx): occupies 33.34-66.66% in about 500 sq.m. area. Sparse (or x): occupies 00.00-33.33 % in about 500 sq.m. area.

#### Surface Water Biology Baseline Monitoring Results

During the first sampling period in February 2015, 35 species of phytoplankton were found in station TS-SW01 - ST-SW03. Range of species in TS-SW1 - TS-SW3 stations were 8- 25- five species. Green Algae and Diatom was the dominant taxa, of which *Phacus*, *Trachelomonas* and *Dinobryon* were the most abundant in TS-SW1. *Xanthidium*, *Micrasterias* and *Spondylomorom* were the most abundant in TS- SW2. *Mougeotia*, *Xanthidium* and *Micrasterias* were the most abundant in TS- SW3. The total abundance of phytoplankton ranged between 379,999 to 33,976,365 units/cu.m. and diversity index of phytoplankton ranged between 1.730 to 2.270 (Table 5.3-3). and **Annex 5-3** Surface Water Biology Analysis Report

Phytoplankton samples collected in TS- SW1 - ST- SW3 in February 2015 were identified and tabulated in Table 5.3-3. Total of 6 classes were found, consisting of Cyanophyceae (blue green algae with 6 species), Chlorophyceae (green algae with 18 species) Euglenophyceae (euglenoids with 3 species) Bacillariophyceae (diatom with 6 species) Chrysophyceae (yellow brown algae with 1 species) and Dinophyceae (dinoflagellate with 1 species).

25 species of phytoplankton were found in station TS- SW4 - TS- SW6 (Kunchaung and Dawei River). Range of species in TS- SW4 - TS- SW6 stations was 13 – 18 species. Green Algae and Diatom was the dominant taxa, of which *Cyclotella*, *Oscillatoria* and *Thalassioseira* were the most abundant in TS- SW4. *Cyclotella*, *Coscinodiscus* and *Thalassioseira* were the most abundant in TS- SW5. *Cyclotella*, *Coscinodiscus* and *Surirella* were the most abundant in TS- SW06. Total abundance of phytoplankton ranged between 8,370,000 to 10,214,400 units/cu.m. and diversity index of phytoplankton was 1.170 to 1.440 (Table 5.3-3).

Phytoplankton samples collected in TS-SW4 - TS-SW6 were identified and tabulated in Table 5.3-3. Total of 5 classes were found, consisting of Cyanophyceae (blue green algae with 1 species), Chlorophyceae (green algae with 5 species) Euglenophyceae (euglenoids with 1 species) Bacillariophyceae ( diatom with seventeen species) and Dinophyceae (dinoflagellate with 1 species).

21 species of zooplankton were identified. Range of number of species per sample at TS- SW1 to TS- SW3 stations were 9- 16 species. Protozoa and copepod were the most abundantly found in all stations. The total abundance of zooplankton ranged between 371,250 to 1,179,550 units/cu.m. and diversity index was 1.270 to 2.120 (Table 5.3-3).

Zooplankton samples collected in TS- SW1 - TS- SW3 were identified and tabulated in **Table 5.3-3**. Total of 5 phyla were found, consisting of Protozoa (protozoan with 4 species),

Nematoda (nematod with 1 species) Gastrotricha (gastrotrich with 1 species) Rotifera (rotifer with 8 species) and Arthropoda (crustaceans with 5 species).

Only 3 species in 3 phyla of zooplankton were found in station TS-SW4 – TS-SW6 (Kunchaung and Dawei River) and were identified and tabulated in Table 5.3-3 (Protozoa, Rotifera and Arthropoda). The total abundance of zooplankton ranged between 129,000 to 180,987 units/cu.m. and diversity index was 0.230 to 1.440 (Table 5.3-3).

As indicated by Wilhm and Dorris (1968), the diversity index ( $H'$ ) is related to surface water quality. The diversity index of phytoplankton of TS-SW1 - TS-SW3 was 1.730 to 2.270 while the index of phytoplankton of TS-SW4 - TS-SW6 was 1.170 to 1.440. The diversity index of zooplankton of TS-SW1 - TS-SW3 was 1.270 to 2.120 while the index of zooplankton of TS-SW4 - TS-SW6 was 0.230 to 1.440. Diversity index results imply that the water quality of water resource near the project area was at moderate conditions and acceptable for aquatic organisms.

#### Benthic Fauna (Benthos)

5 families of benthos were found in station TS-SW1 - TS-SW3. Ranges of benthos families in TS-SW1-TS-SW3 stations were 3-4 families, of which blood worms was dominant in TS-SW1 and TS-SW2 stations. Snail was dominant in TS-SW3 stations. The total density of benthos ranged between 29 to 36 individuals/sq.m. (Table 5.3-3).

Benthos samples collected in TS-SW1 - TS-SW3 were identified and tabulated in Table 5.3-3. Total of 3 classes were found, consisting of Crustacea (shrimp with 1 family), Insecta (insect Larva with 3 families) and Gastropoda (snail with 1 family)

4 families of benthos were found in station TS-SW4 - TS-SW6 (Kunchaung and Dawei River). Ranges of benthos families in TS-SW4 - TS-SW6 stations were 1-3 families, of which calms (bivalves) was dominant in TS-SW4 station. Snail was dominant in TS-SW5 station. And shrimp was dominant in TS-SW6 station. The total density of benthos ranged between 7 - 44 individuals/sq.m. (Table 5.3-3).

Benthos samples collected in TS-SW4 - TS-SW6 were identified and tabulated in Table 5.3-3. Total of 3 classes were found consisting of Crustacea (shrimp with 2 families), Gastropoda (snail with 1 family) Pelecypoda (bivalve with 1 family).

#### Littoral Fauna

5 families of littoral fauna were found in station TS-SW1 – TS-SW3. Ranges of benthic families in TS-SW1 - TS-SW3 stations were 2-4 families, of which shrimp was dominant in all stations. The total density of littoral fauna ranged between 26- 226 individuals/ sq. m. (Table 5.3-3).

Littoral Fauna samples collected in TS-SW1 - TS-SW3 were identified and tabulated in Table 5.3-3. Total of 5 classes were found, consisting of Crustacea (Shrimp with 1 family), Insecta (Insect Larva with 3 families) and Gastropoda (Snail with 1 family).

4 families of littoral fauna were found in station TS-SW4 - TS-SW6 (Kunchaung and Dawei River). Ranges of benthic species in TS-SW4 - ST-SW6 stations were 3 families in all station, of which shrimp was dominant in all station. The total density of littoral fauna ranged between 64 to 176 individuals/sq.m. (Table 5.3-3).

Littoral fauna samples collected in TS-SW4 – TS-SW6 were identified and tabulated in **Table 5.3-3**. Total of 3 classes were found consisting of Crustacea (Shrimp with 2 families), Gastropoda (Snail with 1 family) and Pelecypoda (Bivalve with 1 family).

### Aquatic Flora

Aquatic flora samples collected in February 2015, were identified and shown in Table 5.3-4 . A total of 15 species of aquatic flora found in all station, ranging from 2-6 species per sample in TS-SW1 to TS-SW6 stations, *Actinoscirpus grossus* (coarse bulrush) were dominant in station TS-SW4 to TS-SW6. *Uticularia aurea* (golden bladderwort) were dominant in TS-SW2 and TS-SW3, and *Brachiaria mutica* (signalgrass) were dominant in TS-SW2 the dominant species of aquatic flora were shown in Table 5.3-4 and Figure 5.3-5.

**Table 5.3-4 The Results of Aquatic Flora in The Water Resource near The Project Area**

## Fish

Total of 23 fish species were found, with the range of 2-13 species in TS-SW1 to TS-SW6 stations, of which cyprinid fishes (Cyprinidae: Barb and Minnow) was dominant. The total density of fish were between 900 and 88,200 individuals/hectare, and the total abundance of fishes were between 9.335 and 66.300 kg./hectare (Table 5.3-5 and Figure 5.3-6).

### Fisheries Activities

#### *In Dawei River*

Two pushnet boats and two set bag net were used as the fishing gear by the fishermen during both sampling survey. Moreover, gillnet and hook and line are small fishing gear also being used to catch fishes for household consumption. The fisheries activities in the river were shown in Figure 5.3-7.

#### *In Canal near project area*

Gillnet, fish trap, dip net, fish net and hook are small fishing gear also being used to catch fishes for household consumption in water resource. The fisheries activities in the river were shown in Figure 5.3-7.

**Table 5.3-5 The Results of Fishes in The Water Resource near the Project Area**

Figure 5.3-7 Fisheries Activity near Water Resource

## 5.3.2 Forests

### 5.3.2.1 Study Area

The study area will cover the project boundary together with the area potentially impacted by the project activities. For the forest study, the secondary data from the final report of the Dawei Deep Sea Port and the draft EIA for Dawei Industrial Estate Project includes the study of the wildlife and the impact on wildlife resources caused by project implementation.

### 5.3.2.2 Baseline Forest Conditions

The following information is reviewed for the secondary data and description of the forest conditions in the project area:

- Topographical Map of Tavoy Burma 1:250,000 Series U542, Sheet ND 47-6, Edition 1-AMS, 1957 (USACE, 1957).
- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a). (Figure 5.3-8)
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

#### Methodology

A review of secondary data, regarding forest resources, was conducted at ten plots during 14-21 December 2011. These ten stations were selected to represent areas of natural reserved forestry, within 5 km. from the study of forest temporary sampling plots, forest ecology analysis of the important value index (IVI), and species diversity specific ecosystems.

#### Result of the Studies

The types of forest around the project area can be divided into three forest types: mangrove forest, reserved forest, and natural forest (TEAM, 2012a).

Forest characteristics in the project area are divided in to four forest types: beach forest, mangrove forest; dipterocarp forest; and dry evergreen forest. The situations of the forest vary depending on the level of disturbance from human.

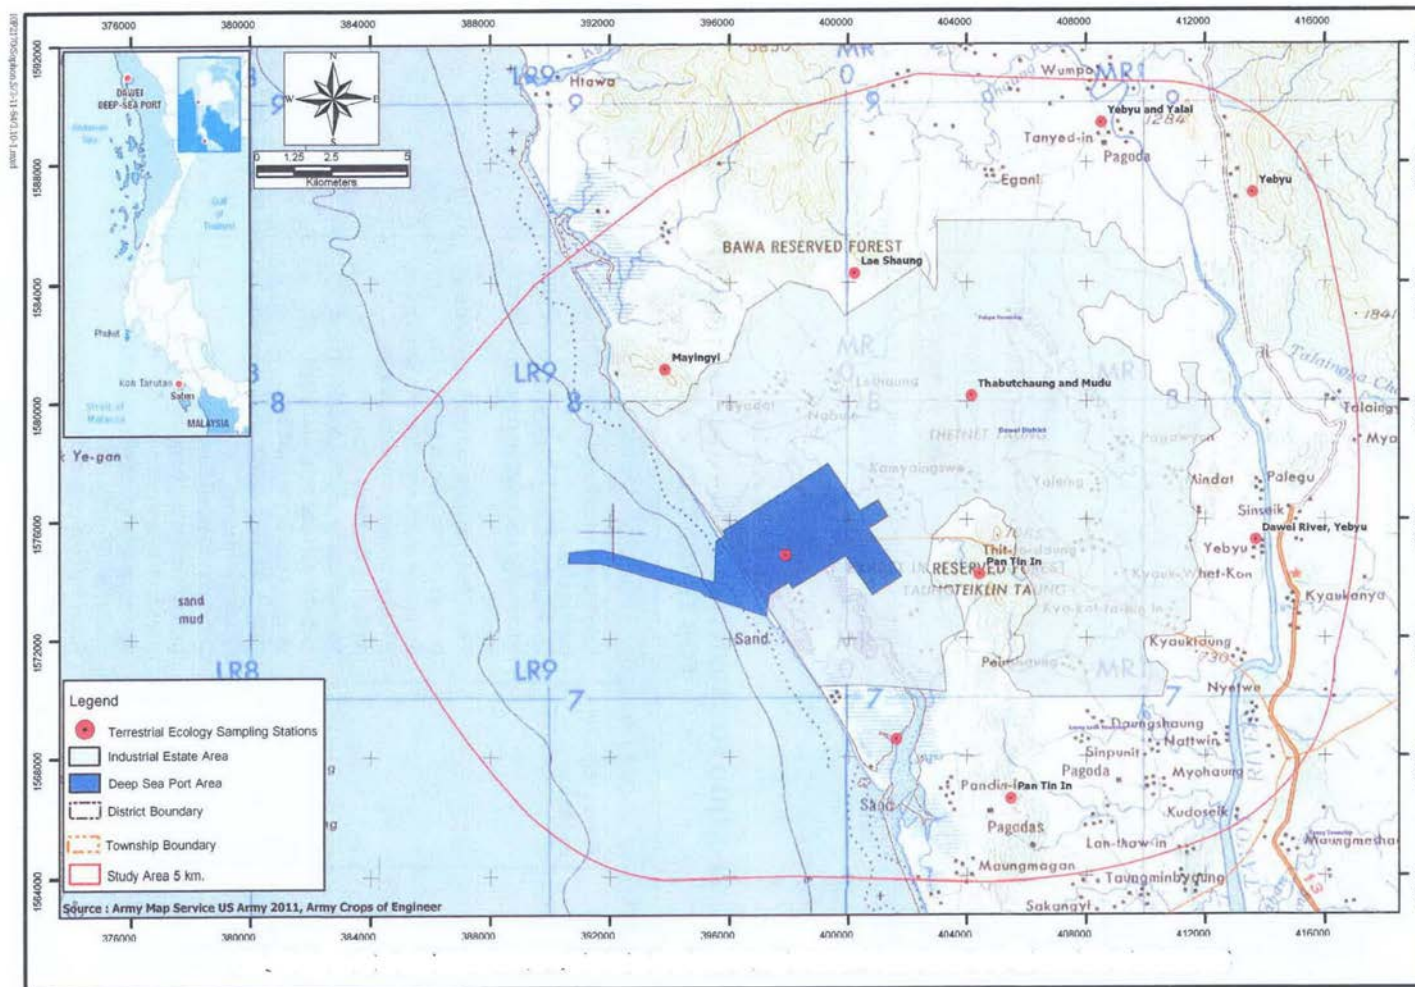

Figure 5.3-8 Forest Sampling Station from Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).

## Mangrove Forest

### i) Forest composition

In 24 sampling plots (0.54 ha), the total number of species with GBH > 10 cm was thirteen. The dominant families of tree species were Avicenniaceae (three species), Rhizophoraceae (three species) and Fabaceae (two species). Combretaceae, Euphorbiaceae, Myrsinaceae, Plumbaginaceae and Verbenaceae have only one species respectively. The level of ecological significance of the tree species in the area is ranked by IVI. The tree layer in the study area is dominated by *Avicennia marina* (Forssk.) Vierh., with the highest IVI of 76.09. The second most dominant species is *Excoecaria agallocha* L. (IVI = 57.14) and *Avicennia alba* Blume (IVI = 37.92) is third. The dominant mangrove species in this area were *Avicennia marina* (Forssk.) Vierh., *Excoecaria agallocha* L. and *Avicennia alba* Blume (Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development conducted).

The forest structure showed that *Rhizophora apiculata* Bl., *Heritiera littoralis* Dry., *Excoecaria gallocha* Linn. and *Olea maritima* Wall. was the dominant species. Other species such as *Bruguiera gymnorrhiza* (L.) Savigny, *Lumnitzera littorea* (Jack) Voigt and *Lumnitzera racemosa* Willd were sporadically distributed in path areas, particularly the area that saline water cannot easily reach.

The floristic structure showed that the average height of trees were about 3 – 12 m. Diameters at breast height of tree were ranged from 2 to 20 cm. Tree canopy layers were divided into upper and lower layers. The density of trees with diameters of breast height more than 60 cm. was, on average, about one tree/ha. The density of trees with diameters of breast height between 30 to 60 cm. was, on average, about 8 tree/ha. The density of trees with diameters of breast height between 10 to 30 cm. was, on average, about 72 tree/ha. Finally, the density of trees with diameters at breast height less than 10 cm. was on average, about 210 tree/ha. 14 species of tree from 12 different families were found. The dominant families of tree species were Rhizophoraceae and Combretaceae (two species). Euphorbiaceae, Labiatae, Leguminosae Caesal-pinioideae, Papilionoideae, Oleaceae, Pandanaceae, Periplocaceae, Pteridaceae, Rhamnaceae and Sterculiaceae have only one species respectively (Figure 5.3-9).

Figure 5.3-9 The Mangrove Forests

ii) *Diversity indices and evenness*

Among the different measurement of species diversity indices, the floristic diversity of the mangrove forest is 1.836.

iii) *Status for conservation concern*

One species found in the Mangrove forests is in the IUCN Red list: *Ceriops decandra* (Griff.) Ding Hou. However, the mangrove forest is far from the Township area.

iv) *Forest composition*

Reserved Forest

In five sampling plots, total number of species with GBH > 10 cm. was 21. The dominant families of tree species were Euphorbiaceae (five species), Annonaceae, Lauraceae, and Rubiaceae (2 species).

The ecological significance of the tree species within the study area is ranked by IVI. The tree study area is dominated by *Dipterocarpus obtusifolius* Teysm., with the highest IVI of 79.06. The second most dominant species is *Aporosa villosa* Bail. (IVI = 60.50) and *Croton joufra* Roxb. (IVI = 42.34) is third. Those species could be considered as the ecological indicator species of the reserved forest. The dominant tree species in this area were *Dipterocarpus obtusifolius* Teysm., *Aporosa villosa* Bail., *Croton joufra* Roxb., *Memecylon plebejum* Kurz and *Xylia xylocarpa* (Roxb.) Taub. The ground layer is dominated by seedlings and saplings of *Croton joufra* Roxb., *Memecylon plebejum* Kurz, *Spermacoce latifolia* Rubl. and *Kaempferia* sp.

ii) *Diversity indices and evenness*

According to the results, the diversity indices of individual sample plot and all sample indices are very low. Diversity value for all sample indices is 1.854.

iii) *Status for conservation concern*

According to the forest reserve's field survey, none of the species in the study area are assessed in the IUCN Red list:

Natural Forest

i) *Forest composition*

In the 19 sampling plots (0.43 ha), the total number of species with GBH > 10 cm. was 98 species. The dominant families of tree species were Euphorbiaceae (13 species), Rubiaceae (8 species), Lauraceae (6 species), Myrtaceae (5 species) and Combretaceae, Lecythidaceae, Lythraceae and Moraceae (4 species) respectively.

The ecological significance of the tree species within the study area was determined by IVI. The tree layer in the study area is dominated by *Cratoxylum ligustrinum* Blume with the highest IVI of 23.76, the second most dominant species is *Duabanga grandiflora* (Roxb. Ex DC.) Walp. (IVI = 17.86) and *Croton joufra* Roxb. (IVI = 16.48) is third. The dominant tree species in this area were *Cratoxylum ligustrinum* Blume, *Duabanga grandiflora* (Roxb. Ex DC.) Walp. *Croton joufra* Roxb., *Aporosa villosa* Bail. and *Aporosa dioica* (Roxb) Muell. Arg. etc. The ground layer is dominated by *Lygodium* sp. (1),

*Rhynchospora corymbosa* (L.) Britt. *Spermacoce latifolia* Rubl. *Kaempferia* sp., *Chromolaena odorata* (L.) R.M. King & H. Robinson, *Helicteres hirtusa* Lour. *Oplismenus compositus* (L.) P. Beauv., *Panicum* sp., *Memecylon plebejum* Kurz, *Helicteres angustifolia* L., *Justicia procumbens* L., *Abrus precatorius* L., and *Curcuma* sp.

ii) *Diversity indices and evenness*

The values of diversity indices and evenness indices of the individual sample plots are relatively high. Diversity value for all samples is 3.4724.

iii) *Status for conservation concern*

According to the field survey of the reserved forest in the study area, one endangered tree species is *Diospyros crumentata* Thwaites. Two critically endangered species are *Dipterocarpus kerrii* King and *Dipterocarpus turbinatus* Gaertn.f, and one valuable species is *Hopea odorata* Roxb; all of which are found in the study area.

### Beach Forest

Beach forest characteristics indicate that the flora has secondary growth patterns, and are disturbed by the presence of human beings. What was natural land has been turned into a Cashew Nut plantation. However, there are some natural trees species that still remain. The forest structure shows that *Casuarina equisetifolia* J.R. & G. Forst., *Syzygium grande* (Wight) Walp. var. *grande* and *Lannea coromandelica* Merr. are the dominant species. Other species such as *Macaranga tanarius* Muell. Arg., *Memecylon scutellatum* Naudin, *Phyllanthus emblica* Linn., *Suregada multiflorum* Baill. and *Zizyphus oenoplia* Mill. are scattered throughout the path.

The floristic structure showed an average height of trees to be about 2 – 12 m. Diameters at breast height of tree range from 3 to 25 cm. Canopy tree layers were divided into upper and lower layers. The density of trees having a diameter, at breast height, more than 60 cm. was on average about 1 tree/ha. The density of trees having a diameter, at breast height, between 30 to 60 cm. was on average about 5 trees/ha. The density of trees having a diameter, at breast height, between 10 to 30 cm. was on average about 60 trees/ha. Finally, the density of trees having a diameter, at breast height, less than 10 cm. was on average about 180 trees/ha. Tree species that were found: seventeen species from ten families including Euphorbiaceae (5 species); Anacardiaceae (1 species); Combretaceae (2 species); Melastomataceae (2 species); Casuarinaceae (1 species); Compositae (1 species); Ceguminosae-Papilionoideae (1 species); Moraceae (1 species) and Myrtaceae (1 species). The numbers of saplings and seedlings were about 280 and 320 trees/ha, respectively. There were few amounts of small trees. The data determined that the natural regeneration of the forest was rather low in quality. The main natural regeneration process of trees, after they have been disturbed or cut down, is to gain nutrients from coppice shoots. Almost all tree species have the ability to make a new shoot by coppicing.

### Dry Dipterocarp Forest

Dry Dipterocarp forests in the project area (Figure 5.3-10) are unique because they are not usually distributed in zones of high precipitation, or close to the sea. It is quite uncommon to find dry dipterocarp forests in areas like the project area, simply because of the presence of moisture. We found that the reason why dry dipterocarp grew in the project area is because of the soil properties of the sand.

The lack of soil nutrition made it limiting for general tree species to grow in the area. These areas are not suitable for agriculture as they use this forest for firewood. The dominant tree species in this area are: *Dipterovarpus obtusifolius* Teysm; *Aporosa villosa* Baill.; *Croton joufra* Roxb.; *Memecylon plebejum* Kurz; and *Xylia xylocarpa* (Roxb.) Taub. The ground layer is dominated by seedlings and saplings of *Croton joufra* Roxb, *Memecylon plebejum* Kurz, *Spermacoce latifolia* Rubl. and *Kaempferia* sp.

The floristic structure showed that the height of trees, with Diameters at breast height of tree ranging from 3 to 22 cm. are about 3 – 11 m. Canopy tree layer were divided into upper and lower layers. The density of trees having a diameter, at breast height, more than 60 cm. were, on average, about 2 tree/ha. The density of trees having a diameter, at breast height, between 30 to 60 cm. were, on average, about 9 tree/ha. The density of trees, having a diameter at breast height between 10 to 30 cm., were on average about 69 tree/ha. Finally, the density of trees having a diameter at breast height less than 10 cm. were on average about 246 tree/ha. Fifteen different species from ten different families were found. The dominant families of tree species were: Euphorbiaceae (3 species); Dipterocarpaceae; Anacardiaceae and Myrtaceae (2 species) respectively. Rubiaceae, Barringtoniaceae, Combretaceae, Connaraceae, Leguminosae-Mimosaceae and Sterculiaceae have only 1 species respectively. The natural regenerations by seed germination and seedling establishment were few and far between. The main process of natural regeneration was coppice from old stumps, particularly from the dominant species, *Dipterovarpus obtusifolius* Teysm.

Figure 5.3-10 The Characteristics of Dry Dipterocarp Forest

### Dry Evergreen Forest

Dry evergreen forests are the main forest types within the project (Figure 5.3-11). However, the dry evergreen forests have been disturbed by oil palm plantations (Figure 5.3-12), rubber tree plantation (Figure 5.3-13), Cashew Nut plantations, paddy field and home gardens. The forests are within the same areas as agriculture land. Because of the agricultural land, the composition of the forests was already different from their natural composition. Almost none of the remaining tree species are pioneer species or coppice from the old stump of the mother tree. The remaining trees are small and dense coppicing trees because they were cut and utilized by the rural people. The dominant tree species in this area were *Cratoxylum ligustrinum* Blume, *Croton joufra* Roxb, *Barringtonia angusta* Kurz, *Aporusa villosa* Baill. and *Aporusa dioica* (Roxb.) Muell. Arg. The ground layer is dominated by *Lygodium* sp. (1), *Rhynchospora corymbosa* (L.) Britt. *Spermacoce latifolia* Rubl., *Kaempferia* sp. *Chromolaena odorata* (L.) R.M. King & H. Robinson, *Helicteres hirsute* Lour., *Oplismenus compositus* (L.) P. Beauv., *Panicum* sp. *Memecylon plebejum* Kurz, *Helicteres angustifolia* L., *Justicia procumbens* L., *Abrus precatorius* L. and *Curcuma* sp.

The floristic structure shows that the average height of trees range is between 3-15 m. with diameters, at breast height, ranging from 4 to 40 cm. Canopy tree layer were divided into layer as upper and lower layer. The density of trees having a diameter, at breast height, more than 60 cm. was about 3 trees/ha. The density of trees having a diameter, at breast height, between 30 to 60 cm. was about 15 trees/ha. The density of trees having a diameter, at breast height, between 10 to 30 cm. was about 85 trees/ha. Finally, the density of trees having a diameter, at breast height, less than 10 cm. was about 260 trees/ha. Twenty-eight different species of trees from 21 different families were found. The dominant families of tree species were: Euphorbiaceae (4 species); Anacardiaceae (2 species); Barringtoniaceae (2 species); Combretaceae (2 species); and Moraceae (2 species) respectively.

Figure 5.3-11 The Characteristics of Dry Evergreen Forest

**Figure 5.3-12 The Characteristics of Oil Palm Plantation**

### 5.3.3 Wildlife

#### 5.3.3.1 Study Area

The study area will cover the project boundary together with the area potentially impacted by the project activities. For the wildlife study, the secondary data of the wildlife and investigates the diversity, abundance, distribution, utilization, present day status of wildlife in the Project area, and the impact of project implementation are reviewed.

#### 5.3.3.2 Baseline Wildlife Conditions

##### Source of Information

- Initial Environmental Examination (IEE) for Dawei Sea Port & Industrial Estate Development (TEAM, 2012a).
- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012).

##### Result of the Studies

According to the study, the diversity of wildlife in and around the study area can be described in four types: reptile; amphibian; avis (birds); and mammal. Generally, the forest in project site was not fertile and a high population of people was present. Any human activity could affect the living wild animals, so the wildlife was not as diverse. Results of 2 studies are summarized in Table 5.3-6.

**Table 5.3-6 Summary of Wildlife Survey Results from Previous Studies**

Type	TEAM Study (2012a)	SEATEC Study (2012c)
Reptiles Species	<p>A total of eight reptiles species were recorded during the surveyed period. Out of the recorded species, the Burmese python (<i>Python molurus bivittatus</i>) is an endangered species listed in the IUCN Red-list. The species <i>Python molurus bivittatus</i>, <i>Ptyas korros</i>, <i>Naja kaouthia</i> are listed under Annex II of the CITES list. The Burmese python (<i>Python molurus bivittatus</i>) and Green tree viper (<i>Trimeresurus gramineus</i>) were noted as forest dwellers and the remaining reptile species were recorded to inhabit other habitats. Garden fence lizard (<i>Calotes versicolor</i>) and Many-lined sun skink (<i>Mabuya multifasciata</i>) were found as common reptile species distributing in all habitats of the studied area.</p>	<p>A total of 20 reptile species were recorded during the survey period. The recorded species were not included in any lists. The species of reptile were classified to two orders consisting of Chelonia and Squamata, and ten families consisting of Testudinidae (one species), Gokkonidae (four species), Agamidae Scincidae (four species), Uromastycidae (three species), Varanidae (one species), Pythonidae (one species), Pythonidae (one species), Colubridae (three species), Elapidae (one species) and Viperidae (one species). Almost all reptiles that were found in the project area were living in a terrestrial forest, such as dry dipterocarp forest and under growth of the dry evergreen forest, except the Water Monitor Lizard (<i>Varanus salvator</i>) which lives in the river bank area. All of reptiles that were found in the project area are known as common reptile species that are distributed in all habitats of the study area. The study area is only livable to adaptable species, because the project site has been constantly disturbed by people.</p>
Amphibians Species	<p>Seven amphibian species were recorded during the survey period. Among these recorded species, the Paddy frog (<i>Rana limnocharis</i>) is listed as an endemic species in Myanmar. The frogs and toads recorded are common in the study area, and large populations were observed in the paddy fields and grassland. The species <i>Rana limnocharis</i> and <i>Rana limnocharis</i> were observed in large population within the paddy field. The common toad (<i>Bufo melanostatus</i>) was observed particularly in human habitation areas. <i>Rana</i> species are more active during the monsoon season.</p>	<p>A total of thirteen other amphibian species were recorded during the surveyed period. Four families of amphibians, consisting of Bufonidae (four species), Ranidae (five species), Rhacophoridae (one species) and Microhylidae (three species) belong to the <i>Anura</i> family. Among these recorded species, the Common Black-Spinned Toad (<i>Bufo melanostictus</i>), Malayan Giant Toad (<i>Bufo asper</i>), Pearl-tripped Pustiled Puddle Frog, (<i>Occidozyga magnapustulosus</i>) Marten's Puddle Frog (<i>Occidozyga martensii</i>), Marsh Frog (<i>Fejervarya limnocharis</i>) and Malayan Giant Frog (<i>Rana blythii</i>) were observed within the riverbank area or paddy fields. Others species, including Flat-Headed Toad (<i>Bufo macrotis</i>), Dawf Toad (<i>Bufo parvis</i>), Common Tree frog (<i>Rhacophorus leucomystax</i>), Striped Spadefoot Frog (<i>Calluella guttulata</i>), Common Burrowing Frog (<i>Microhyla pulchra</i>), and Ornated Chorus Frog (<i>Microhyla ornate</i>) were normally found in the under growth of dry dipterocarp forest and dry evergreen forest. The common toad (<i>Bufo melamostatus</i>) was observed particularly in human habitation areas. All amphibian species are more active during the monsoon season.</p>

**Table 5.3-6 Summary of Wildlife Survey Results from Previous Studies (Cont.)**

Type	TEAM Study (2012a)	SEATEC Study (2012c)
Mammals Species	<p>A total of fourteen mammal species were recorded during the survey period. Among the recorded species, the East Asian Porcupine (<i>Hystrix brachyuran</i>) and Long-tail Goat (<i>Naemohedus caudatus</i>) were listed under vulnerable species in the IUCN Red-list. The Slow Loris (<i>Nycticebus coucang</i>). The Asiatic Black Bear (<i>Ursus thibetanus</i>), The Jungle Cat (<i>Felis chaus</i>) and The Sund Pangolin (<i>Manis javanica</i>) were listed under Annex II of the CITES list, while the Long-tail Goat (<i>Naemohedus caudatus</i>) was listed under Annex I. The two squirrel species, Palla's Squirrel (<i>Callosciurus erythraeus</i>) and Variable Squirrel (<i>Callosciurus finlaysonii</i>) were observed as common species residing in orchards and human habitation areas. The Asiatic Black Bear (<i>Ursus thibetanus</i>) was recorded as relatively rare in the proposed project area.</p>	<p>A total of sixteen mammal species were recorded during the survey period; however, they were not recorded in any lists. The species of mammals were classified in to five orders: Insectivora; Chiroptera; Primates; Carnivora; and Rodentia. They were classified in to seven families: Tupaidae (one species); Pteropodidae (one species); Cercopithecidae (two species); Viverridae (two species); Herpestidae (one species); Sciuridae (three species); and Muridae (six species). Most of the mammals that were in the project area were living in a terrestrial forest such as the dry dipterocarp forest and the under growth of the dry evergreen forest, except The Water Small Asian. Mongoose (<i>Herpestes javanicus</i>) which live in river bank area. The three squirrel species, Variable Squirrel (<i>Callosciurus finlaysonii</i>), Indochinese Ground Squirrel (<i>Menetes berdmorei</i>) and Himalayan striped Squirrel (<i>Tamiops macclellandi</i>) were observed as common species living in orchards and human habitation areas. All of the mammals were found in the project area however, the common mammal species were adapting to all habitats in the study area. Because of all the destruction brought on by human activity, only small adaptable mammals remain.</p>
Avis (Bird) Species	<p>A total of thirty-seven bird species were recorded during the survey period. Members of the family Ardeidae, Little egret (<i>Egretta garzetta</i>) Cattle egret (<i>Bubulcus ibis</i>) Indian pond heron (<i>Ardeola grayii</i>) and Chinese pond heron (<i>Ardeola bacchus</i>) are found near the water and are listed as water bird species. Apart from the species Family Ardeidae, four other water bird species were also observed: Little grebe (<i>Tachybaptus ruficollis</i>); Red-wattled lapwing (<i>Vanellus indicus</i>); and the common sand piper (<i>Actitis hypoleucos</i>) were also noted as water bird species. The bird of prey species were: Oriental Honey-buzzard (<i>Pernis ptilorhynchus</i>); Shikra (<i>Accipiter badius</i>) and the Black Kite (<i>Milvus migrans</i>). The Barn swallow (<i>Hirundo rustica</i>) and the common myna (<i>Acridotheres tristis</i>) were recorded as common species in the proposed project area. Threatened species were not observed in the area.</p>	<p>A total of sixty-seven bird species were recorded during the survey period. All of the bird species were common species that could be found in general areas. Threatened species were not observed in the area; however, the species of bird were very diverse in order, family, and species level. It may be caused by the project area consisting of various ecosystem types from mountainous to beach. The species of birds that were found in the project area were classified to twelve different orders: Pelecaniformes (one family); Anseriformes (one family); Ciconiiformes (one family); Falconiformes (one family); Charadriiformes (one family); Columbiformes (one family); Cuculiformes (one family); Strigiformes (one family); Apodiformes (two families); Coraciiformes (four families); Piciformes (one family); and Passeriformes (fifteen families). The habitats of avis were different depending on bird species; however, it could be divided into three main zones: swamp and beach area; grassland and paddy field area; and under growth and forest area. Among the avis family, Phalacrocoracidae, Anatidae, Ardeidae, Charadriidae, and Aicedinidae preferred to use swamp and beach area in beach forest and mangrove forest. Family Accipitridae, Columbidae,</p>

**Table 5.3-6 Summary of Wildlife Survey Results from Previous Studies (Cont.)**

Type	TEAM Study (2012a)	SEATEC Study (2012c)
		<p>Cuculidae, Meropidae, Coraciidae, Bucerotidae, Megalaimidae, Megalaimidae, Pycnonotidae, Dicruridae, Oriolidae, Corvidae, Timaliidae, Turdidae, Muscicapidae, Dicaeidae, Sturnidae, and Estrilidae preferred to use under growth area of dry dipterocarp forest and dry evergreen forest. Additionally, Strigidae, Apodidae, Hemiprocnidae, Hirundinidae, Alaudidae, Motacillidae, and Sylviidae preferred to use grassland and paddy field areas.</p>
<p>Status for conservation concern</p>	<p>According to IUCN (2008), only one specie of the one hundred forty-three wildlife species on location is considered an endanger species. Two of the mammal species in the proposed project area are considered as valuable species. In addition, there are two species of mammals considered near threatened species.</p>	<p>The list of wildlife species shows that only the common species live in the undergrowth of the area that is disturbed by humans. The total amount of wildlife: one hundred sixty-seven species: fifty-one families; and twenty orders. All of the species found in the project area were not on any conservation lists. The species found were common species and could adapt to living general area.</p>

## **5.4 SOCIO – ECONOMIC COMPONENTS**

### **5.4.1 Initial Township Development**

#### **5.4.1.1 Study Area**

Myanmar is still in the stage of developing the township sectors. Major industries in Myanmar are agriculture and mining. Initial Township Project will bring township complex that has not existed in the area near the city of Dawei.

#### **5.4.1.2 Baseline Township Development Conditions**

General information of industry types in Myanmar is extracted from the following document

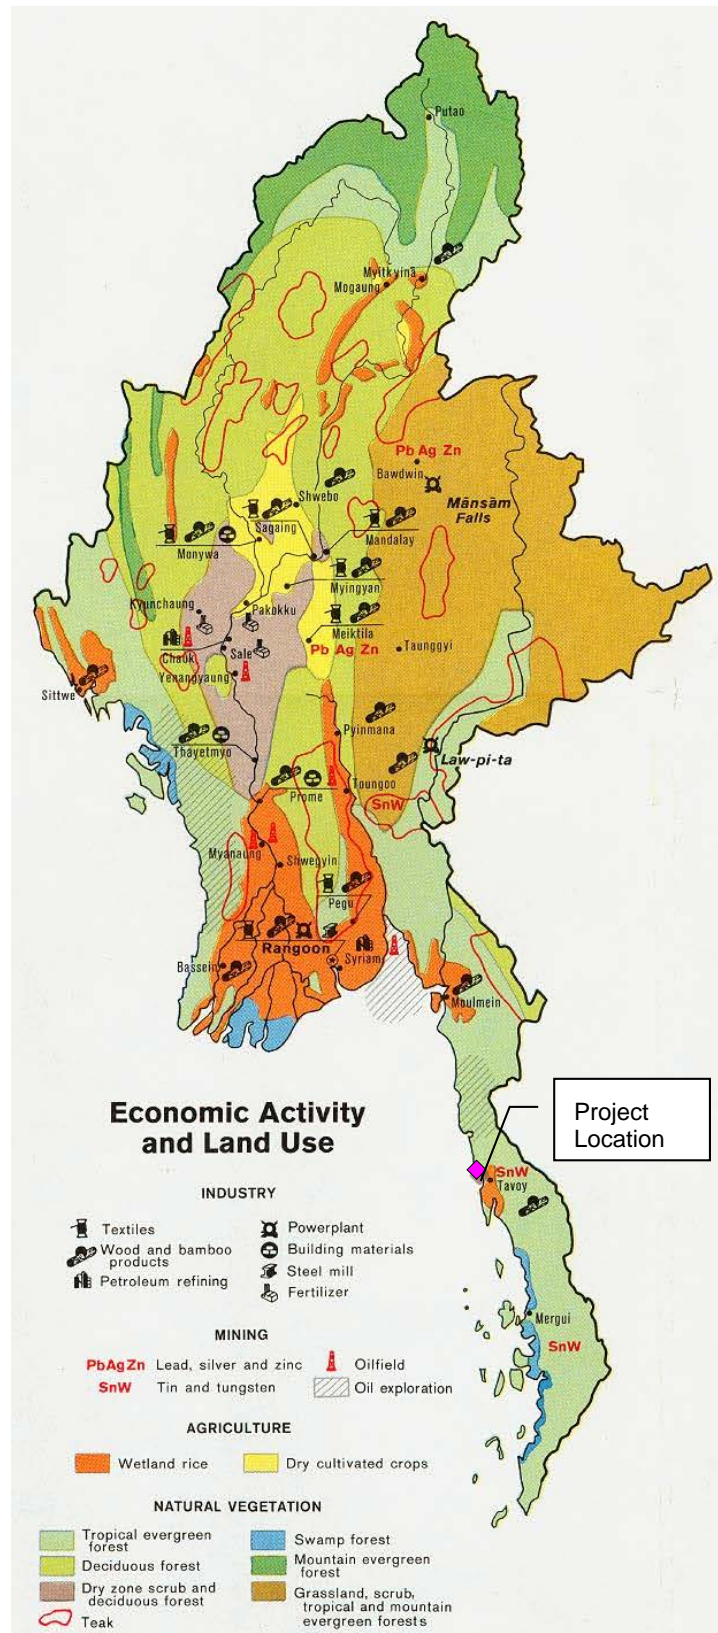

- Economic Activity and Land Use Map (U.S. CIA, 1972)

The broad information from the document above is reviewed together with the site observation.

#### Results of the Studies

There are seven types of major industries in Myanmar: textiles; power plants; wood and bamboo products; petroleum refining; building materials; steel mill; and fertilizer. Most of the industries are located in the central part of Myanmar (Figure 5.4-1).

For the area around Dawei city and the project vicinity, there are two types of industry: wood and bamboo product; and tin and tungsten mining. Site observation during baseline sampling did not indicate any major industries in and around the area.

### 5.4.1.3 Communities and Population

#### (a) Settlement Pattern and Age of Community

According to the village survey, the settlement pattern of most villages is lining along the road. Only three villages; Payadat, Lae Shaung and Kha Maung Chaung are settled in cluster form. The age of most of communities is 200 years and the average age of 18 villages is 177 years (Table 5.4-1).

#### (b) Community Administration

Most villages have the administrative structure, which mixes traditional customary laws with governmental attributes and structures. The village heads rule the villages according to existing laws regulated by the government authorities in the Township but at the same time the elderly persons are appointed as advisors or the judicial body according to the local traditions. The village committees are formed and are also involved in the village's administrative body. Three to seven villages will belong to a village's administrative tracts, and the combination of village tracts becomes a Township (Dawei Project Watch, 2012).

**Table 5.4-1 Settlement Pattern and Age of Community of 18 Villages**

Village	Settlement Pattern	Age of Community (years)
Mayin Gyi	Line along the road	200

<b>Average</b>		<b>177</b>

(c) Number of Population

The village survey found that there are 5,834 households in 18 villages. The total number of population is 35,443 that divided into 16,628 males and 18,805 females. The highest population is at Pagaw Zoon village (7,700) while the lowest population is at Nyaung Bin Seik village (328). Were shown in Table 5.4-2. In the number of households, populations, males, and females in affected villages.

Regarding migration, the survey reveals that some people in all 18 villages work outside the village all year. This finding is consistent with TEAM report (2012b) which stated that large numbers of people in all affected villages have migrated regularly for employment in Thailand.

Both male and female emigrants are employee. The average wage/day of male emigrants is 8,556 Kyat while the average way/day of female emigrants is 6,778 Kyat. The emigrants from Thit Toh Taut and Kyauk Whet Kone Village obtain the highest wages (Table 5.4-4).

**Table 5.4-4 Type of Emigrant's Work and Wage per Day**

Village	Type of Emigrant's Work		Wage/Day (Kyat)

*(e) Ethnic Group*

According to the literature review, there are some ethnic groups in Dawei. Few of them are Kayin. Karen communities have a slightly different administration from the majority of the Tavoyan and Mon people in coastal area. These areas are conflicted with opposing administration areas, some parts the government or local Burmese Army has taken hold, while in other areas the main Karen armed opposition, Karen National Union (KNU) has some influences with the Karen village heads (Dawei Project Watch, 2012).

However, there is no data about ethnic group in 18 affected villages due to REM's village survey in 2013.

#### 5.4.1.4 Education

The education system in Myanmar is divided into 4 levels; pre-school education, primary education, secondary education, and higher education (UNESCO, 2011). The primary education is free and compulsory (Myanmar Ministry of Education, 2012).

Before 1886, the literacy rate of Myanmar was 85%. But the literacy rate dramatically fell to 35% in the colonial period. In 1973, the Ministry of Education introduced adult literacy program of 3Rs (Read, Write and Arithmetic) program for the illiterates throughout the nation. Since 1996, summer literacy programs and 3Rs classes have been opened. Every summer, literacy programs are undertaken in the Regions and States including border areas, and as a result, the literacy rate of Myanmar rose from 79.7 percent (in 1998) to 95.01 percent (in 2011) as shown in Table 5.4-11 (Myanmar Ministry of Education, 2012)

**Table 5.4-5 Basic Education Indicator of Myanmar (1998 and 2011)**

No.	Indicator	1998	2011	Increase (%)
1	Net Intake Rate (NIR) of age 5+ in kindergarten	67.13	98.37	31.24
2	Net Enrollment Rate (NER)			
	Primary level age (5-9)	74.70	84.61	9.91
	Middle school level age (10-13)	23.60	47.16	23.56
	High school level age (14-15)	10.10	30.01	19.91
3	Completion Rate by Level (2009 – 2010)			
	Primary level age (5-9)	24.80	81.20	56.40
	Middle school level age (10-13)	47.10	71.70	24.60
	High school level age (14-15)	29.32	30.83	1.51
4	Transition Rate (2009 – 2010)			
	Primary level to middle school level	45.60	80.18	34.58
	Middle school level to high school level	53.70	90.57	36.87
5	Teacher – Student Ratio	1.43	1.29	
6	Adult Literacy Rate (2011)	79.7	95.01	15.31

Source: Myanmar Ministry of Education (2012)

According to REM field survey (2013), each village has one school excepting Kya Khat Tabin in village which has two schools. The total number of schools in the project area is 19 as shown in Table 5.4-6

**Table 5.4-6 Number of Schools in the Affected Villages**

#### 5.4.1.5 Land Use and Land Holding

Dawei is a completely agrarian society. The region constitutes a long pristine coastline with the enrichment of marine and mineral resources. The towns of Kanpauk, Heinda and Hamyingi in Dawei District have long been home to several mines which produce tin and tungsten, essential metals useful in steel industry. Off the Dawei coastline, the region is close to a large natural gas reserve in the Andaman Sea. In the vast hinterland, the region is green with paddy fields and plantations of rubber, beetle nut, cashew nut and durian. Also, the local villagers rely on fishing in the Maungmagan coastline and Nipa palm (locally known as Dani) forests along Dawei River (Aung, 2011).

Regarding the land use of two townships that have been affected by the project, Yebyu and Laung Lone still have a large area unoccupied, which are mostly of forest, virgin land and uncultivated land. The majority of occupied area is agricultural land. Hence, agriculture is the primary occupation in this area. Rice is grown mostly for household consumption. The soil fertility can be indicated by cultivation of various types of plantations such as rubber, cashew nut, bamboo, oil palm, coconut, betel, and various fruit trees (TEAM, 2012b).

Land use in Yebyu and Laung Lone Townships is described as follows;

### Yebyu Township

Yebyu township is bounded by Ye township to the north, Laung Lone township to the south, Kaleinaung township to the east, and Andaman Sea to the west. It covers an area of 604,663 acres (2,446.98 km<sup>2</sup>). According to the data from Land Records Department of Dawei District (2011), the area is still mostly unoccupied as only about 12 percent are active agricultural land while about two-third are forest land, and the remaining are not fully utilized (Table 5.4-7).

**Table 5.4-7 Type of Land Utilization in Yebyu Township**

No.	Type of Land Use	Area		Percentage
		Acres	Km <sup>2</sup>	
1	Forest Land	201,012	813.5	33.24
2	Uncultivated Land	146,728.7	593.8	24.27
3	Cultivable Waste Land	131,450.2	532	21.74
4	Agricultural Land	72,703.3	294.2	12.02
5	Virgin Land*	52,655.7	213	8.71
6	Fallow Land	113	0.5	0.02
<b>Total Land</b>		<b>604,663</b>	<b>2,447</b>	<b>100</b>

\* Land which has not yet been cultivated or used

**Source:** Land Records Department, Dawei District (2011)

### Laung Lone Township

Laung Lone Township is bounded by Yebyu in the north, Andaman Sea to the west, Dawei Township to the east, and Thayetchaung Township to the south in Thaninharyi Region, southern part of Myanmar. Its size is much smaller than Yebyu (227,787 acres or 921.8 km<sup>2</sup>). About one-third of total area is utilized for agricultural purposes while nearly two-third of the area is not utilized (combination of forest, virgin, uncultivated land, etc) as shown in Table 5.4-8.

According to the village profile survey in 18 affected villages, the average land holding per one household is 5.33 acres. The highest average land holding per household is in Kha Maung Chaung Village (15 acres/household) while the lowest average land holding per household is in Mudu and Pan Din In Village (1 acres/household).

The land use for residential area of 18 villages is only 0.83 acres / household. The residential land use per household of most villages is 1 acre while the residential land use of 6 villages (Mayin gyi, Yalai, Pagaw Zoon, Mudu, Thit Toh Taut, and Pan Din In) is 0.5 acres per household.

**Table 5.4-8 Type of Land Utilization in Laung Lone Township**

No.	Type of Land Use	Area		Percentage
		Acres	Km <sup>2</sup>	
1	Forest Land	78,255.8	316.69	34.35
2	Uncultivated Land	68,806	278.45	30.21

6	Fallow Land	12	0.05	0.01
<b>Total Land</b>		<b>227,787</b>	<b>921.8</b>	<b>100</b>

\* Land which has not yet been cultivated or used

**Source:** Land Records Department, Dawei District (2011)

Most of land use in eighteen villages is for agricultural purpose (average 6.33 acres/ household). Kha Maung Chaung Village has the highest average land use for agricultural area (15 acres/ household), followed by Min Dut Village (12 acres/ household), Payadat Village, Htain Gyi Village, and Wet Chaung Village (10 acres/ household). Mudu village has the smallest average land use for agricultural area (only 2 acres/household). The Average land holding and land use per household. (were shown in Table 5.4-9)

**Table 5.4-9 Average Land Holding and Land Use**

Village	Average Land Holding (Acres/ Household)	Average Land Use (Acres/ Household)	
		Residential Area	Agricultural Area

Source: SEATEC in association with UAE (2013)

Regarding land issue, most of villages indicate that they have land rights; excepting Nyaung bin seik Village that does not obtain land rights document. The average land price of village area, paddy field, and orchard (garden) is 3,093,750 kyats/acres, 900,000 kyats/acre and 2,000,000 kyats/acre; respectively. However, the land price data of two villages: Wet Chaung and Nyaung Bin Seik is not available. Table 5.4-10 shows land rights and average land price of village area, paddy field and orchard area.

**Table 5.4-10 Land Rights and Average Land Price**

Village	Land Rights	Land Price (kyat/ acre)		
		Villagearea	Paddyfield	Orchard/Garden
Mayin Gyi	Yes	3,000,000	1,000,000	1,200,000
Payadat	Yes	3,000,000	1,000,000	1,500,000

Remark: n/a = data is not available

### Land use in Project Area

In the past, the most of landuse in the project area were agriculture purpose i.e. plam plantation of Myanmar's Government and crops and tree plantation of villages. The palm plantation is up to 80% of the study area. In the present, the palm plantation are clearcut for project development. Comparison of the project area in year 2013 (Before Clearcutting) and in year 2016 (After Clearcutting) are shown in Figure 5.44-

Year 2013

Year 2016

Source:www.goggle.com

Figure 5.44- The Comparison of Landuse of Project Area in Year 2013 between to Year 2016

## 5.4.2 Health Profile

### 5.4.2.1 Study Area

The area of study focuses on division level (Thanintharyi), district level (Dawei) and precisely in the village level. According to Transnational Institute (2012), 32,274 people (3,977 households) in 19 villages in Laung Lone and Yebyu townships of Dawei District will be affected by the relocation. These 19 villages are the direct targets of this study.

As a result of the industrial estate development, 16 villages have to be relocated. The host area for resettlement includes 3 villages: Bawah existing; Pagaw zoon; and Pan Din In. The migrants from 16 villages may have to adapt themselves to the new environment and to change the way of life. Local people in the host villages may be also affected by the conflict with migrants and competition to access public resources. The number of population and households in these 19 affected villages is shown in **section 5.4.3** Population and communities.

### 5.4.2.2 Scope and Methodology

The aim of this study is to evaluate the potential impacts of project development on public health and occupational health. The proposed scope of work will at least cover the following concerns:

- Data collection on public health and epidemic, including public hygiene problems, environmental sanitary use, diseases-endemic, seasonal epidemics, and other contagious diseases of local people living downstream and those relocated to provided residence
- Nutrition condition: a comparison between the local people and the neighborhood
- Identification of ecological conditions susceptible to an increase in the parasitic condition of aquatic carriers such as fish and mosquitoes (as carriers of malaria, dengue, etc.)
- Evaluation of existing data of health and sanitary condition of people in the community near the project site
- Assessment of obtained data focusing on an induction of the project development on an increasing of health determinants stressors and other occupational or environmental illness of local people living downstream
- Investigation of public health problems due to diseases enhanced by the project existence
- Suggestion on mitigation measures.

### 5.4.2.3 Sources of Information

Sources of data include primary and secondary information. For primary data collection, the socio-economic survey was conducted on 11 – 18 February 2013 by Myanmar Consultant (REM). The socio-economic survey covers 371 households in 18 affected villages (16 villages in the industrial estate area and 2 villages for resettlement area). The secondary data sources include previous EIA reports, academic journals and official websites which are:

- Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013).

- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c)
- IEE Environmental Studies for Dawei Sea Port & Industrial Estate Development Project (TEAM, 2012a).
- 2011 Socio-Economic Data (Dawei Township Office, 2012 (in Burmese))

Public health and occupational health impact assessment is the process of evaluating the potential impact caused by project activities, which likely affect the determinants of health. This topic presents the condition of existing health determinants which have the potential to be influenced by project activities. The identified data are incorporated into the health impact assessment process, as discussed in Chapter 6 of this report ( Impact Assessment) . The sources of baseline data included in this chapter are as shown in Table 5.4-11.

**Table 5.4-11 Baseline Data Classified by Health Determinants and Sources of Data**

Baseline Data for Health Impact Assessment	Primary	Secondary
1) Physical Environment	✓	
2) Social Environment	✓	✓
3) Economic Characteristic		✓
4) Health Status		✓
5) Accident and Public Safety	✓	✓
6) Sufficiency and Capacity of Health Service Facilities	✓	✓
7) Person's Individual Characteristic/ Behaviors		✓
8) Infrastructure and Public Service	✓	✓

#### 5.4.2.4 Baseline Findings

The determinants of health to evaluate the health impacts of project activities:

##### (a) Physical Environment

The physical environment, e.g. air quality, noise and vibration, may lead to public health impact as presented in section 5.2 respectively. According to the social attitude survey, the existing physical environment problems are water supply, solid and waste water management, dust and noise from construction, bad odor, etc. as shown in **Chapter 9 Public Involvement and Disclosure**.

##### (b) Social Environment

Information of the social environment, including political structure, population characteristic, and social status is shown in **section 5.4 Socio-Economic Components**.

##### (c) Economic Environment

The economic environment including population income, household income, and expenditure is shown in **section 5.4 Socio-Economic Conditions**.

(d) Health Status

The health status of the Thanintharyi region can be considered from the morbidity rate, mortality rate and public health service capacity which have been collected from the Ministry of Health:

Morbidity Rate

The most five common diseases in Thanintharyi region are malaria, diarrhea, tuberculosis, dysentery and liver cirrhosis. Malaria has been the most widespread disease with more than 13,000 cases treated in 2011 however no casualties due to the diseases are reported. In community level, malaria is also the most common disease and can be found in almost every month as shown in Table 5.4-12, Table 5.4-13 and Figure 5.4-2, respectively.

**Table 5.4-12 Widespread Disease**

Township / Subtownship	Disease (visit) in 2011									
	Malaria		Diarrhea		Tuberculosis		Dysentery		Liver cirrhosis	
	Sick	Death	Sick	Death	Sick	Death	Sick	Death	Sick	Death
Dawei	4,292	0	1,263	0	124	0	454	0	0	0

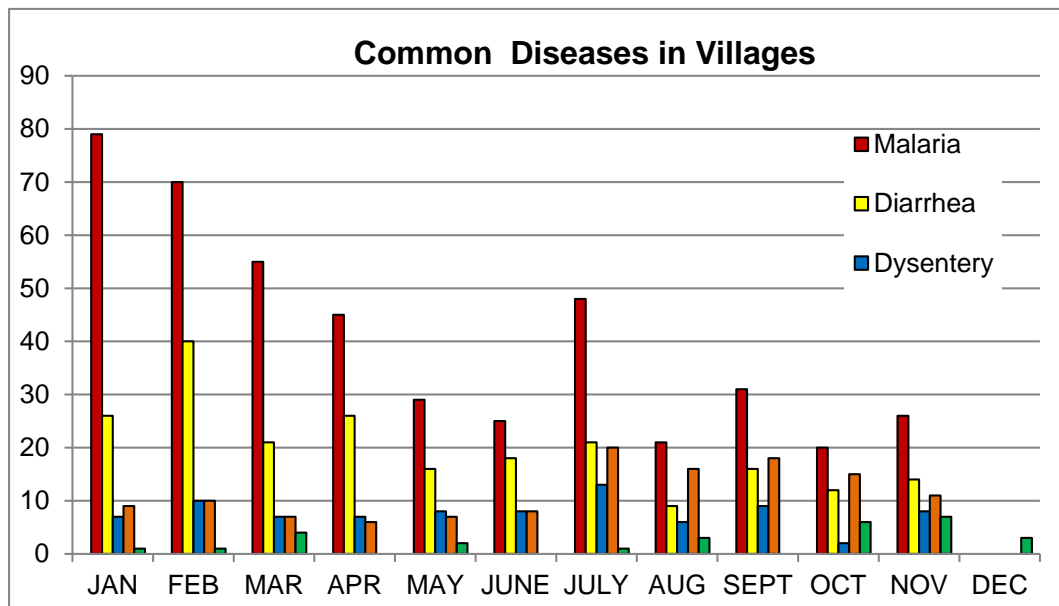

Figure 5.4-2 Common Diseases in Villages

Mortality Rate

The Ministry of Health reports that the Thanintharyi region has a mortality rate for under 5 years old children of 93.63 per one thousand live birth and a maternal mortality rate of 3.07 per one thousand live birth as shown in Figure 5.4-3 and Figure 5.4-4 respectively. In addition, the miscarriage rate is high in Yebyu while the mortality rate of Laung Louné is highest as presented in Table 5.4-14. These data indicate that the health care facilities as well as health education in the region is quite poor compared with other areas of the country.

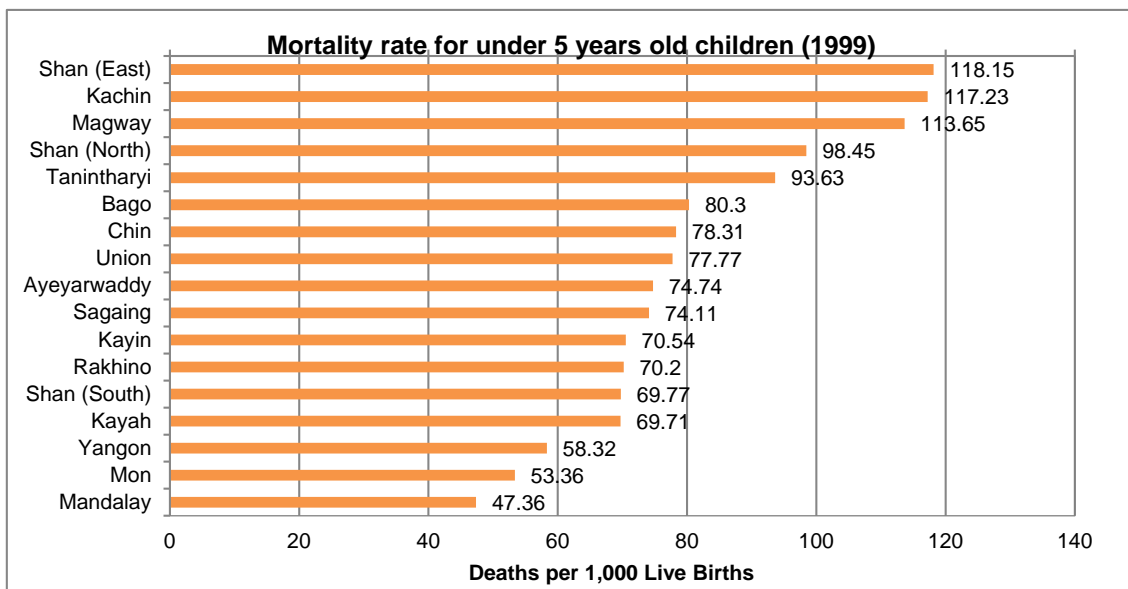

Figure 5.4-3 Mortality Rate for under 5 Years Old Children (1999)

### Health Problems and Treatment

In the project area, the most common non communicable disease is hypertension where as the most common communicable disease is malaria.

In addition, the communities have given their opinion regarding to sickness. Most of the respondents did not have any sickness in the previous year (30.2%). The major sickness of most respondents included cough, stroke, and gaiter disease ( 22.6% ), followed by communicable disease ( 18.3% ) and heart and cardiovascular disease ( 12.7% ). Most of the respondents went to see the doctor at hospital to cure their sickness ( 71.2% ) while 11.6 percent of the respondents did not do anything to cure their sickness.

#### *(e) Accident and Public Safety*

Excluding the unidentified cases, the primary cause involving with public safety is car and motorbike accidents during 2010-2011. The number of cases due to burglar and thieves in 2011 is higher than in 2010 as shown in Table 5.4-15.

**Table 5.4-15 Thieves and Accident Cases**

Type	2010				2011			
	No. of Cases	No. of Lawsuit	Lawsuit Suspended	Not going to court	No. of Cases	No. of Lawsuit	Lawsuit Suspended	Not going to court
Burglar / Thieves	12	7	4	1	15	10	4	1
Normal accidents	11	10	0	1	18	18	0	0
Car and motorbike accidents	40	32	3	5	62	56	5	1
Others	62	54	1	7	88	87	1	0
Total	125	103	8	14	183	171	10	2

Reference: Dawei Township Office. 2012.2011 Socio-Economic Data (in Burmese)

*(f) Sufficiency and Capacity of Health Service Facilities*

Health Service Provider

Health service providers in this project area include 34 health service facilities that belong to the Government, and eight of private health service facilities. There is one large hospital located at Dawei, three of medium size hospitals located at Yebyu, Laung Lone and Thayetchaung as well as six specific medical clinic dealing with leprosy, malaria and tuberculosis located at Dawei, Yebyu, Laung Lone and Thayetchaung as shown in Table 5.4-16. However, some villages have no health service facilities, the villagers have to visit the health center located at the village nearby.

**Table 5.4-16 Number of Health Service Provider**

Township / Subtownship	Hospital				Clinic				
	Government			Private	Government				Private
	Small <16 beds	Medium >25 beds	Large (100 beds)		Village	Leprosy	Malaria	TB	
Dawei	0	0	1	4	4	1	1	1	4
Yebyu	1	1	0	0	3	0	0	1	0
Laung Lone	2	1	0	0	6	0	0	1	0
Thayetchaung	1	1	0	0	4	0	0	1	0
Mitta (subtownship)	1	0	0	0	0	0	0	0	0
Ka Lain Aung (subtownship)	1	0	0	0	1	0	0	0	0
Total	6	3	1	4	18	1	1	4	4

Reference: Dawei Township Office. 2012.2011 Socio-Economic Data (in Burmese)

Public Health Professionals and Facilities

According to the ministry of health, there are 11 medical doctors per 100,000 populations in the Thanintharyi region in 2007. In comparison, the overall country is 17 while of the Yangon Region is 46 doctors per 100,000 populations. Additionally, there are 22 nurses per 100,000 people and 22 midwives per 100,000 populations in 2009 as shown in Figure 5.4-5 and Figure 5.4-6.

Figure 5.4-5 Availability of Nurses

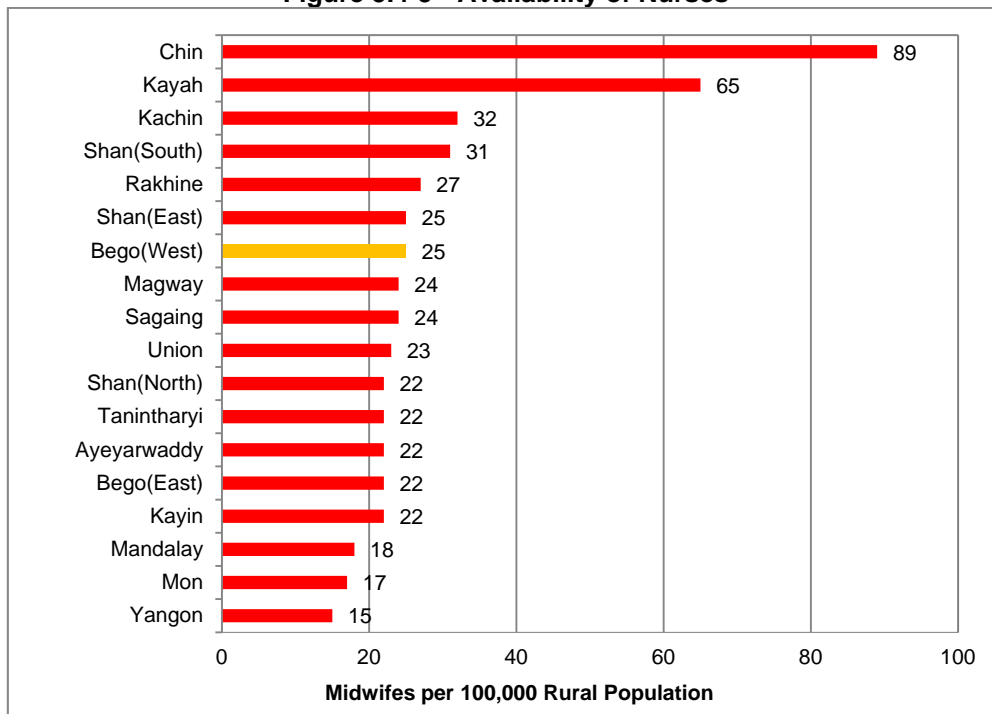

Figure 5.4-6 Availability of Midwives

In the study area, there are 20 doctors, 68 nurses and 22 nurse assistant, most of them working in Dawei, Laung Lone and Thayetchaung as presented in Table 5.4-17.

**Table 5.4-17 Medical Staff**

Township / Subtownship	Population	Doctors		Nurses		Nurse Assistants	
		Number of Doctors	Ratio	Number of Nurses	Ratio	Number of Nurse Assistants	Ratio
Dawei	204,280	6	34,046	10	20,428	7	29,182
Yebyu	145,321	3	48,440	10	14,532	2	72,660
Laung Loune	211,920	5	43,984	18	13,217	6	36,653
Thayetchaung	181,870	4	45,467	19	9,572	4	45,467

Ka Lain Aung (subtownship)	18,052	1	18,052	5	3,610	1	18,052
Total	791,772	20	39,588	68	11,643	22	32,726

Reference: Dawei Township Office. 2012.2011 Socio-Economic Data (in Burmese)

#### Health Care Centre and Manpower

There are 2 rural health centers with health assistance and a senior blue nurse (LHV Lady Health Assistance) in Lae Shaung and Pan Din In village. Most of the people around the study area visit these clinics for treatment of minor illness such as common cold, cough, headache and dizziness. Most villagers depend on a public drug store and health assistance to solve their health problems. If they suffer serious illness, they are admitted to Dawei hospital because of better health care equipments and services.

Most people in this area have hypertension. Thus, they should regularly check their blood pressure at a rural health center. For the people who are diagnosed with hypertension, they are referred to the closet health center; i. e. Maungmagan Sub-township Hospital or General Hospital of Dawei.

#### Availability of and Accessibility to Healthcare Services

Development of the project, both construction and operational phases, may cause an increase of morbidity and mortality rate which may pressure on public health resources including the number of service facilities, number of health professions, medical equipments, and devices. From field survey conducted during 11 – 18 February 2013, they stated that the most distance between some villages to health center is about 23 Km and ten villages have health volunteers (as shown in Table 5.4-18). Half of the respondents said that the number of physician and nurse was sufficient (50.7%) while the other half (49.3%) said that the physician and nurse were insufficient. However, most of the respondents (92.5%) reported that the specialist physicians such as surgeon, environmental and occupational medicine were insufficient. Regarding to the location of public health service, 44.7 percent of the respondents said that they were convenient to access the public health service while 53.9 percent of the respondents indicated that the location of public health service was too far and inconvenient. Most of the respondents (95.1%) reported that they had to pay for medical charge while 3.5 percent of the respondents got the government supports. And Healthcare centers in the project area was shown in Figure 5.4-7.

**Table 5.4-18 Number of Hospital and Health Center in Project Area**

Village	Number of Hospital	Number of Health Center	Distance from Major Health Service (km)	Health Volunteer
Mayin Gyi	0	0	3.0	No

Health Care Centre (Pan Din In Village)

**Figure 5.4-7 Health Care Centers in the Project Area**

(g) Person's Individual Characteristic/ Behaviors

The results of the survey indicated that 70.8% of people have smoke tobacco and 12% of people drink alcohol regularly Figure 5.4-8. Drinking alcohol and Smoking can cause many kinds of diseases including hypertension, heart disease, lung disease, and cancer.

(h) Source of Food

From the result of filed survey, main source of food of the respondents was from the self-plantation ( 84.72% ) followed by buying from market ( 9.94% ) and natural resources/fishery/forest/river (5.56%). Some villages for example, Mayin Gyi Min Dut, Nyaung Bin Seik and Pan Din In are closed to the sea therefore the source of food for people come from sea. The detail is shown in Table 5.4-19.

Figure 5.4-8 Usage of Alcohol and Tobacco

**Table 5.4-19 Percentage of Source of Food**

*(i) Infrastructure and Public Service*

The details of infrastructure and public service within the study area such as the water supply, waste management, electricity, etc. as followed.

Water supply

The primary source of domestic water supply, in the study area, is the shallow well. Other sources of water, for local villages, are from artesian wells and rain fall. Normally, there are one or two shallow wells that supply water among one village. For the project site, the water supply for local agricultural purposes is primarily from the Dawei River. There are four rivers: Nabule River; Dawei River; Kunchaung River; and Pan Din In Chaung River near and within the project site. However, the water supply is not adequate during the dry season.

In the project development area, artesian wells are a source of water during the construction phase.

Most households, in the affected villages, have good water source from shallow wells and streams in the Bawah village. Pan Din In has limited water resources and often experiences water shortages in the dry season. In this village, some households have to share wells with the others, and some have to pay a fee to well owners due to limited water

availability, especially in the dry season. In general, the water quality is good for consumption. And domestic water supply in project area was shown in **Figure 5.4-9**

**Figure 5.4-9 Domestic Water Supply**

Drinking water quality is in good condition around the project area (Figure 5.4-10). More than 50% of the villagers use the filter treatment and 26.5% boil water before consumption.

**Figure 5.4-10 Drinking Water**

Most of the interviewed respondents use groundwater (93.8%) as source of drinking water, followed by tap water (3.5%) and river/ canal (0.3%).

### Electricity

In the nearby area of the project site, local villagers have no electricity supply system. Only some households generate electricity from small generators; e. g. main generator (400 kV) and 7- 10 kV of generators which the household members share cost for diesel fuel (Table 5.4-20).

In the project development area, the main generators are used for electricity generation during construction. The electricity in the project area was turned off during 12:00-13:00 and 22:00-03:00.

There is no electricity system supported either by the government or by private companies in these villages. Some villagers possess small generators and generate electricity to share so that their neighbors can have power at night time; however, they have to pay in terms of their utilization and electricity supply in project area was shown in Figure 5.4-11.

Figure 5.4-11 Electricity Supply

Table 5.4-20 Electricity supply

Township / Subtownship	Demand (kW)	Government Generation (kW)	Private Generation (kW)	
			No. of Generators	Generation Capacity (kW)
Dawei	8,800	3,800	2	3,800
Yebyu	1,000	170	2	170
Laung Lone	1,670	480	3	500
Thayetchaung	1,360	180	1	180
Mitta (subtownship)	350	26	1	26
Ka Lain Aung (subtownship)	410	70	1	70
Total	13,590	4,746	10	4,746

Reference: Dawei Township Office. 2012.2011 Socio-Economic Data (in Burmese)

### Environmental Sanitary: Solid Waste Management and Wastewater System

In the Dawei area, environmental sanitation, such as solid waste and wastewater treatment system, is inadequate, resulting in poor environmental sanitation. Presently, Dawei does not have proper management on solid waste and sanitation. The solid waste is collected and disposed of by open dumping or open burning within their household (Figure 5.4-12). For organic waste, most of villager feed to their pig and cow. Tough toilet systems are relatively available in Htain Gyi, Lae Shuang, Mudu and Payadat. Provision of both solid waste and wastewater systems are rather limited in all villages.

During the construction phase, the solid wastes in the project site are: domestic waste; (plastic bag and food waste) and waste from construction activities (Steel scrap, etc.) The domestic waste is collected in the garbage bins which are set at all camp sites and canteens. Then, the waste is collected everyday and dumped in the landfill within project area. When the domestic waste inside landfill is full, the landfill is covered by soil. The waste from construction activities is collected in the storage area for reuse.

The results of field survey also indicate that public health services in local communities are quite limited. For household wastewater management, most of the respondents discharge wastewater to the ground (82.2%), followed by discharge to public

drainage system (5.9%), discharge into the garden (5.1%) and discharge to the public river (4%).

Regarding to solid waste disposal, most of the respondents manage by open burn (93.8%), followed by pile up outside the house (2.7%), landfill (2.2%) and throw away to public area (0.8%). Only 0.3 percent of the respondents make fertilizer from solid waste. And domestic solid waste disposal in project area was shown in Figure 5.4-12.

Figure 5.4-12 Domestic Solid Waste Disposal

### Road

The roads in the project site and local villages are unpaved surface about 4 m width. Most of the roads can be accessed year round but the condition is relatively poor; especially in the wet season and road condition in project area was shown in Figure 5.4-13.

In addition, the results from the attitude survey show that the most common problem related to infrastructure/public services are a shortage of drinking/ consumption water, shortage of electricity, inconvenient transportation, flood, and solid waste management as shown in **Chapter 9 Public Involvement and Disclosure**.

Figure 5.4-13 Road Condition

(j) Health Service in Current Camp Site

Currently ITD has provided health service at the campsite (Figure 5.4-14) with the physician at all time. Three common illnesses are respiratory disease, skin disease and gastrointestinal disease. Malaria is also found with small number of incident (Table 5.4-21 and Figure 5.4-15). The ambulance car is always in use for transfer the serious case to Dawei hospital. Health education is also performed.

### 5.4.3 Infrastructure Facilities

#### Study Area

Infrastructure facilities, such as water supply, waste management, electricity, and communication facilities are inadequate in Myanmar. Therefore, the Initial Township Project, will have to generate all of its infrastructures onsite. The project influence area (impact zone) of the Initial Township Project was determined as the infrastructure involves large quantity of earth moving and clearing of existing vegetation in the area.

#### Baseline Infrastructure Facility Conditions

The conditions of baseline infrastructure facilities have been surveyed in the previous studies. The source of information in this section is:

- Environmental Impact Assessment (EIA) for the Dawei Deep Sea Port (TEAM, 2013).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

Field survey and data collection of infrastructure facilities in villages within and nearby the project area was also conducted as part of social and public health infrastructure survey. More information from the site survey can be found in **Section 5.4.3**

#### 5.4.3.1 Water Supply

The primary source of domestic water supply in the study area is the shallow groundwater wells. Other sources of water for local villages are from artesian wells and rain. Normally, there are one or two shallow wells to supply water among one village. For the project site, the water supply for local agricultural purpose is primarily from Dawei River. There are four rivers, namely Nabule River, Dawei River, Kunchaung River and Pan Din In Chaung River near the project site; however, the water supply is not adequate during dry season.

In the project development area, artesian wells are a source of water supply in the project site during construction phase.

#### 5.4.3.2 Electricity

In nearby area of project site, local villagers have no electricity grids. Only some households are able to generate electricity via a small generator; e.g. main generator (400 kV) and 7-10 kV of generators which the household members share cost for diesel fuel. In other larger villages, generators are located in the village's temple with small distribution system connecting the generators with the households, and the villagers share the cost of fuel and maintenance.

#### 5.4.3.3 Solid Waste Management

Presently, Dawei does not have proper management on solid waste and sanitation. The solid waste is collected and disposed of by open dumping or open burning within their household. For organic waste, most villagers feed the waste to their pigs and cows.

#### 5.4.4 Traffic and Transportation

##### Study Area

Around and inside the project area, there were only local roads in poor conditions. There were no transportation routes in the project site. When Initial Township Project is developed, the internal access roads will be constructed for supplying the construction materials within project area. Therefore, the traffic is expected to be increased in the surrounding area. The project influence area (impact zone) is considered to be the nearby communities and households within the project area.

##### Baseline Traffic and Transportation Conditions

Baseline traffic and transportation has been surveyed in the previous relevant studies. These are:

- Environmental Impact Assessment (EIA) for Main Road (SEATEC, 2012c).
- IEE Environmental Studies for Dawei Sea Port & Industrial Estate Development Project (TEAM, 2012a).
- Draft Environmental Impact Assessment for Dawei Industrial Estate Project (SEATEC in association with UAE, 2012)

The studies include survey of traffic volume on the main local roads. The results of the studies can be summarized below.

### Land Transportation

There is only one main road within a five km. radius from the complex zone: Highway no. 8; which is a two lane, paved road, with no shoulder and under poor condition. The other secondary roads for transporting between villages are dirt roads.

The road condition at the project site and local village is laterite surface, about 4.0 m. wide. Most of the roads can be accessed all year round, but conditions are relatively poor, especially in the wet season.

The traffic survey was reviewed at Kamyawkin point, located at North Latitude 14.0942o and East Longitude 98.1795o in the northwest of Dawei city on the Dawei-Nabule Road. Recorded vehicles included express buses, mini buses, trucks, vans and pickup trucks. The largest amount of passenger cars was found at the Dawei-Thayetchaung and the Dawei-Kyauknimaw routes. Most of the cars on these routes were express buses, minibuses, and pickup trucks (Table 5.4-22). Yangon-Dawei-Myeik and Mawlamyine-Dawei-Myeik routes also pass through the project area. There are seven cars daily from the Yangon-Dawei-Myeik route. Most of the cars and buses are running on the local road network.

**Table 5.4-22 Passenger Cars Recorded Around Project Area**

<b>Trips</b>	<b>Number of Cars per day</b>
Dawei-Thayetchaung	40
Dawei-Kyauknimaw	24
Dawei-Yebyu	19
Dawei-Laung Lone	17

Source: TEAM (2012a)

In 2011, the highest traffic volume was observed during August. The traffic volume observed at Kamyawkin point in August was 8,384 vehicles. Total traffic volume during April and September is 47,508 vehicles (Table 5.4-23). The highest numbers of vehicles were express buses and mini buses.

**Table 5.4-23 Passenger Cars Recorded at Kamyawkin Point**

Months	Number of Vehicles				Total
	Above 5 tons	3-5 tons	1-3 tons	Below 1 ton	
April	296	1,048	58	6,264	7,666

**Figure 5.4-16 Map of Traffic survey Location (Kamyawkin Point)**

Each category of vehicles has its own Passenger Car Unit (PCU) which can be calculated in form of Passenger Car Equivalents (PCE), with conversion factor in Table 5.4-25.

**Table 5.4-25 Passenger Cars Equivalent Factor of each Vehicles**

Type of vehicle	Passenger Car Equivalents Factor (PCE)
Passenger Car and Taxi	1.00
Light Bus	1.25
Heavy Bus	2.00
Light Truck	1.50
Medium Truck	1.75
Heavy Truck	2.00
Motorcycle	0.33
Bicycle, Tri-cycle	0.20

Source: 1. Puopong Ninjunpansri, 1997. Highway Engineering Department of Civil Engineering, Faculty of Engineering. Rachamongkol Technology Institute, 312 p.  
2. Department of Highway, 2001. Highway Traffic Report

The result of traffic volume in terms of PCU/ hour at Kamyawkin point can be described in Table 5.4-26, which showed that PCU/hour for working hours (estimate 10 hours) in Kamyawkin point was 69.45. The obtained V/C Ratio will be used for comparison with the standard values for future traffic condition with assumptions as listed in Table 5.4-27.

The V/C ratio of the existing condition can be calculated as shown in Table 5.4-28. The result showed that the traffic condition is very high traffic flow.

**Table 5.4-26 The PCU/Day Result of Vehicles on the Kamyawkin Point**

Types of Vehicle	Average Number of Vehicle During 1-2 October 2011 (No./day)	PCU/day	PCU/hr <sup>1/</sup>
< 1 ton (Motorcycle)	1178	388.74	38.87
1-3 tons (Light Truck)	130	195	19.5
3-5 tons (Light Bus)	55	68.75	6.88
>5 tons (Heavy Truck)	21	42	4.2
Total	1384	694.49	69.45

### Air Transportation

There is a local airport at Dawei. All international flights are operated by Myanmar Airways International. Air Mandalay, Air Kanbawza, Asian Winds, Air Bagan and Yangon Airways are for domestic passengers. Flight time from Yangon to Dawei is about one hour.

### Railways

Dawei-Yay railroad is running through Yebyu Township in the North-South direction parallel to the Dawei – Yay Highway. Dawei-Yebyu railroad section was completed on 30 May 1995 and Yebyu – Kaleinaung railroad was opened on 1st July, 1996. It was totally completed and opened on 26th May, 1998. The length of railroad from Dawei to Yay is about 166.0 km. From Dawei to Yebyu, it is about 17.0 km. There are 22 stations between Dawei and Yay stations. At present, from Dawei to Mawlamyine, Myanmar Railways provide transport service with three diesel locomotives, five carriages, and one wagon. The train leaves Dawei at 5:15 am. and reaches Mawlamyein at 9:15 pm.

### Water Transportation

Only cargo boats utilize the Dawei jetty. Passengers to Yangon, Myeik and Kawthang use speed boats from Thayetchaung jetty. There are two speed boats for passenger services.

## **5.4.5 Land Use**

### **5.4.5.1 Study Area**

The proposed project will alter existing land use in the project area. A high portion of the project area and nearby areas is used for agricultural purposes. A number of villages are also located within the project boundary. This section describes the existing land use prior to development of Initial Township.

### **5.4.5.2 Baseline Land Use Conditions**

The source of secondary information on the land use conditions in the project area include:

- The Geology of Burma (Myanmar): An Annotated Bibliography of Burma's Geology (USACE, 2008)
- Land use survey map from Italian Thai Development Plc.

Site survey as part of socio-economic and public health conditions was also conducted. More information regarding land use survey in each village can be found in **Section 5.4.5**

#### Results of the Studies

The project area is on relatively flat plains among a mountain range that runs along the coast line of the Southern part of Myanmar. Some parts of the project cover the lower ridge along the coast, while the majority is on the relatively flat area sloping to the sea. There are extensive networks of natural drainage channels on these plains created by considerable amount of surface run-off from mountainous areas surrounding the project land. The main natural drainage of the whole area is the Dawei River and Thanintharyi River, along with their tributaries.

Examination data from land use survey provided by the survey team of Italian Thai Development Plc. On site, there are three major types of land use on and around the project area.

- Agricultural Land: Flat plains are, for the most part, extensively cultivated with crops and paddy fields. Plantations are found on the higher ground, the lower parts of the ridges. Major types of plantations are oil palm, cashew nut, rubber, and some are coconut and betel palm.
- Forest Land: Deciduous forest still covers the mountainous area where they are not easily accessible or with steep slope.
- Rural Settlements: There are 16 villages in the project area.

**Section 5.4.5** provides more detailed information of land use from review of government's information and site survey.

## 5.5 CULTURAL COMPONENTS

### 5.5.1 Historical and archeological sites

According to local legends, there were 17 towns that had been established by different kings during the 15th Century until the 18th Century until the British occupied lower Burma in the first Anglo-Burmese War. The local Tavoyan people are very proud of Buddhism and their cultures, because they believe that the Lord Buddha visited their region. The Tavoyan dance of carrying water with pots (made of mud) was a well-known dance in the communities. Many communities have various Buddhist heritages exemplified in their monasteries and have preserved and maintained this religious and cultural value from generation to generation (Dawei Project Watch, 2012). This information is supported by Moore (2011) who stated that Dawei community remains a strong element of present Dawei culture. This can be seen in the local dialect, songs and the neighborhood-village public role in important festivals in Dawei town and surrounding pagodas. The founding story of many of these is woven into the founding story of Thagara involving a prince, Maung Nwa (Mr. Bull) who becomes a hermit. From the union of the hermit and a Nakoma fish, the first dynasty of Thagara emerged. As noted above, on the Weidi side of the Dawei River, place names are traditionally seen to refer to the Buddha's previous life as a buffalo king versus his life as a royal peacock on the Dawei side of the river.

The village profile survey by REM (2013) found "Foot Print of Buffalo Pagoda" in Payadat Village and "Nabule Settawyar or Buddha Foot Print" in Lae Shaung Village. Moreover, there is one monastery in Mudu Village and two pagodas (one in Min Dut and the other in Pan Din In Village). The historical and archeological places in the project area are listed in Table 5.5-1. Pictures of the historical and archeological places are shown in Figure 5.5-1.

**Table 5.5-1 Historical and Archeological Places in the Project Area**

Village	Historical/ archeological places

## CHAPTER 6 IMPACT AND RISK ASSESSMENT AND MITIGATION MEASURES

### 6.1 INTRODUCTION

This chapter provides assessment of potential impacts to the environment due to project activities as described in Chapter 4. The assessment of potential impacts is conducted on key physical resources, ecological resources, economic development and social and cultural resources, using quantitative approach wherever possible. Mitigation measures discussed in this chapter are explained in **Chapter 8 Environmental Management Plan**.

### 6.2 CONSTRUCTION PHASE

#### 6.2.1 Physical Components

##### 6.2.1.1 Air Quality

Potential impacts to the air quality during construction activities are generally from the following sources:

- Dust from transportation routes, which are unpaved, and transported materials;
- Dust from construction site, and cleared land; and

Impacts caused by the above activities are commonly localized to the area close to the source.

The potential drift distance of particles is governed by the initial injection height of the particle, the terminal settling velocity of the particle, and the degree of atmospheric turbulence. Theoretical drift distance, as a function of particle diameter and mean wind speed, has been computed for fugitive dust emissions. Results indicate that, for a typical mean wind speed of 16 km./hr. (10 mph), particles larger than about 100 micron are likely to settle out within 6 to 9 meters (20 to 30 feet [ft.]) from the edge of the road or other point of emission. Particles that are 30 to 100 microns in diameter are likely to undergo impeded settling. These particles, depending upon the extent of atmospheric turbulence, are likely to settle within a few hundred feet from the road. Smaller particles, particularly smaller than about 15 microns have much slower gravitational settling velocities and are much more likely to have their settling rate retarded by atmospheric turbulence.

Impacts occurred only during construction period. Dust suppression methods, such as water spray and cover of bulk materials on trucks, will be required to reduce the impacts due to the activities. Burning of vegetation will be limited to only other methods are not practical, and the vegetation has to be piled and burned in the area away from the sensitive receptors such as communities and work camps

##### 6.2.1.2 Noise and Vibration

This section contains noise and vibration evaluation of potential impacts during construction and operation phases. However, the main concern is on the noise and vibration generated by the project activities during construction phase than the operation phase when most of the processes and equipment are typically enclosed.

The noise levels created by construction equipment will vary greatly depending on factors such as the type of equipment, the specific model, the operation being performed, and the condition of the equipment. The equivalent sound level ( $L_{Aeq}$ ) of the construction activity also depends on the fraction of time that the equipment is operated over the time period of construction. This section provides information on typical levels of noise and vibration generated by various construction equipment and assessment of potential impacts due to their operation.

(a) Noise

Diesel engine, without sufficient muffling. Some construction processes generate noise also, i.e. impact pile driving or pavement breaking. For noise assessment, construction equipment can be considered to operate in two modes, stationary and mobile. Stationary equipment operates in one or more days at a time, with either a fixed power operation (i.e. compressors and generators) or a variable noise operation (i.e. pile drivers) or to and from the site (trucks). Variation in power imposes additional complexity in characterizing the noise source level from a piece of equipment. This is handled by describing the noise at a reference distance from operating at full power and adjusting it based on the duty cycle of the activity to determine the  $L_{Aeq}$  of the operation. Typical noise levels from representative pieces of equipment are listed in **Table 6.2-1**.

The purpose of the assessment is to determine not only the levels, but also the duration of the noise. The  $L_{Aeq}$  of each phase is determined by combining the contributions from each piece of equipment used in that phase. A construction noise assessment is performed by comparing the predicted noise levels with criteria established for the project. The recommended method for predicting construction noise impact is suggested by the Federal Highway Administration (FHWA).

$$L_{Aeq \text{ equip}} = E.L. + 10 \log(U.F.) - 20 \log(D/50) - 10G \log(D/50)$$

Where:

- $L$  (equip) is the  $L$  at a receiver resulting from the operation of a single piece of equipment over a specified time period
- E.L. is the noise emission level of the particular piece of equipment at the reference distance of 50 feet, taken from **Table 6.2-1**.
- $G$  is a constant that accounts for topography and ground effects, for hard ground  $G = 0$
- $D$  is the distance from the receiver to the piece of equipment
- U.F. is a usage factor that accounts for the fraction of time that the equipment is in use over the specified time period.

**Table 6.2-1 Construction Equipment Noise Emission Levels**

Equipment	Typical Noise Level (dBA) 50 ft (15 m) from Source

Source: US.EPA (1971)

The following assumptions are adequate for a general assessment of each phase of construction:

- Full power operation for a time period of one hour is assumed because most construction equipment operates continuously for periods of one hour or more at some point in the construction period. Therefore, U.F. = 1, and  $10 \log(U.F.) = 0$ .
- Hard field conditions are assumed and ground effects are ignored. Consequently, G = 0.
- Emission level at 50 feet, E.L., is taken from **Table 6.2-1**.
- All pieces of equipment are assumed to operate at the center of the project.
- The predictions include only the two noisiest pieces of equipment expected to be used in each construction phase.

The predicted noise levels in the distance of 100 ft. (33 m) to 3300 ft. (1000 m.) from construction equipment sources are estimated as shown in **Table 6.2-2**. The selected noise source emission levels range from 85 to 101 dB(A) which covers all the noise emission from construction equipment. The highest noise source is 101dB(A) from pile-driver (impact type) and the estimated noise level is 70.6dB(A) at 1650ft (500m). Therefore any noise source lower than 101 dB(A) will result in noise level lower than 70 dB(A) at 500 m. However the community in the distance of less the 500 m may be affected from noise when comparing to the measured  $L_{eq}$  24- hr (45.9 – 55.4dB(A)) of station A2 and A6 .Construction within 500 m from the any sensitive receptors such as communities therefore have to be controlled either by restricting the construction to day-time only, or an agreement has to be made with the nearby villagers should extended working hours are needed.

**Table 6.2-2 Estimated Noise Levels from Various Equipment at 100 ft. to 3,300 ft**

E.L. (dB(A))	$L_{Aeq, equip}$ (dB(A))				
	D=100 ft.	D=330 ft.	D=660ft.	D=1650ft.	D=3300ft.

Pile-driver (Impact) (101 dB(A))	95.0	84.6	78.6	70.6	64.6

Source: US.EPA (1971)

The noise impact criteria in **Table 6.2-3** are based on comparison of the existing outdoor noise levels and the future outdoor noise levels from the proposed project. The noise criteria and descriptors depend on land use, as defined in **Table 6.2-4**.

As indicated in **Table 6.2-4**, the noise impact criteria and descriptors depend on land use, designated Category 1, Category 2, or Category 3. Category 1 includes uses where quietness is an essential element in their intended purpose, such as indoor concert halls or outdoor concert pavilions or National Historic Landmarks where outdoor interpretation routinely takes place. Category 2 includes residences and buildings where people sleep, while Category 3 includes institutional land uses with primarily daytime and evening use such as schools, places of worship and libraries.

Should there be any of the structures or facilities of these categories within the range of distances from the construction equipment given in **Table 6.2-2** and the comparison shows that noise level generated from the equipment may exceed the recommended noise levels; construction activities should be limited to the time that is least disturbing to the receptors.

**Table 6.2-3 Noise Levels Defining Impact for Transit Projects**

Existing Noise Exposure* L <sub>Aeq</sub> (h) or L <sub>Adn</sub> (dB(A))	Project Noise Impact Exposure,*L <sub>Aeq</sub> (h) or L <sub>Adn</sub> (dB(A))

\* L<sub>dn</sub> is used for land use where nighttime sensitivity is a factor; L<sub>eq</sub> during the hour of maximum transit noise exposure is used for land use involving only daytime activities.

**Table 6.2-4 Land Use Categories and Metrics for Transit Noise Impact Criteria**

Land Use Category	Noise Metric (dB(A))	Description of Land Use Category
1	Outdoor L <sub>Aeq</sub> (h)*	Tracts of land where quietness is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor use. Also included are recording studios and concert halls.
2	Outdoor L <sub>Adn</sub>	Residences and buildings where people normally sleep. This category includes homes, hospitals and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
3	Outdoor L <sub>Aeq</sub> (h)*	Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds and recreational facilities can also be considered to be in this category. Certain historical sites and parks are also included.

Source: Transit Noise and Vibration Impact Assessment, FTA (2006).

\* L<sub>Aeq</sub> for the noisiest hour of transit-related activity during hours of noise sensitivity.

*(b) Vibration*

The result of construction activities is various degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings founded on the soil in the vicinity of the construction site respond to these vibrations, with varying results ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibrations at moderate levels, and slight damage at the highest levels.

Ground vibrations from construction activities do not often reach the levels that can damage structures, but they can achieve the audible and feelable ranges in buildings very close to the site. In this case where prolonged annoyance or damages from construction vibrations are not expected, a qualitative assessment is appropriate.

Construction vibration may be generated from blasting, pile-driving, vibratory compaction, demolition, and drilling or excavation in close proximity to sensitive structures. The existing conditions of the area do not have any high-rise buildings or structures that may be sensitive to vibration. Some religious places, such as pagodas and temples, exist, but presumably these places will be relocated before the construction activities can commence close to them. Overall impacts due to vibration from construction equipment are expected to be negligible.

Notwithstanding, should a quantitative assessment of vibration impacts from construction is needed in the future, the guidance below can be used.

Damage Assessment

Select the equipment and associated vibration source levels at a reference distance of 25 feet from **Table 6.2-5**. Make the propagation adjustment according to the following formula (this formula is based on point sources with normal propagation conditions):

$$PPV_{equip} = PPV_{ref} (25/D)^{1.5}$$

where:

- PPV (equip) is the peak particle velocity in in/sec of the equipment adjusted for distance
- PPV (ref) is the reference vibration level in in/sec at 25 feet from **Table 6.2-5**.
- D is the distance from the equipment to the receiver.

Apply the vibration damage criteria from Table 6.2-6.

Vibration Source Levels from Construction Equipment

A major concern with regard to construction vibration is building damage. Construction vibration is generally assessed in terms of peak particle velocity (PPV). Various types of construction equipment have been measured under a wide variety of construction activities with an average of source levels reported in terms of velocity as shown in **Table 6.2-5**. The table gives one level for each piece of equipment, it should be noted that there is a considerable variation in reported ground vibration levels from construction activities. The data provide a reasonable estimate for a wide range of soil conditions.

**Table 6.2-5 Vibration Source Levels for Construction Equipment (From Measured Data.)**

Equipment		PPV at 25 ft (in/sec)
Pile Driver (impact)	upper range	1.518 (38.5572 mm)
	typical	0.644 (16.3576 mm)
Pile Driver (sonic)	upper range	0.734 (18.6436 mm/s)
	typical	0.170 (4.318 mm/s)
Clam shovel drop (slurry wall)		0.202 (5.1308 mm/s)
Hydromill (slurry wall)	in soil	0.008 (0.2032 mm/s)
	in rock	0.017 (0.4318 mm/s)
Vibratory Roller		0.210 (5.334 mm/s)
Hoe Ram		0.089 (2.2606 mm/s)
Large bulldozer		0.089 (2.2606 mm/s)
Caisson drilling		0.089 (2.2606 mm/s)
Loaded trucks		0.076 (1.9304 mm/s)
Jackhammer		0.035 (0.889 mm/s)
Small bulldozer		0.003 (0.0762 mm/s)

Source: UAE (2016)

Construction Vibration Criteria

The primary concern regarding construction vibration relates to potential damage effects. Guideline vibration damage criteria are given in **Table 6.2-6** for various structural categories.

**Table 6.2-6 Summary of Building Damage criteria in DIN 4150-3:1999**

Type of structure	Short-term vibration			Long-term vibration
	PPV at the foundation at a frequency of			PPV at horizontal plane of highest floor (mm/s)
	1 -10Hz (mm/s)	1 – 50Hz (mm/s)	50 - 100 Hz (mm/s)	
Commercial/Industrial	20	20 – 40	40 – 50	40
Residential/School	5	5 – 15	15 – 20	15
Historic or sensitive structures	3	3 – 8	8 – 10	8

Source: UAE (2016)

### 6.2.1.3 Topography and Soil

The project area is a relatively industrial estate main road on the north, high terrain and Dawei River, the area along the eastern boundary of DSEZ on the east, light industrial estate on the west, and agricultural plain area on the south. Mountains and highlands surrounding the project area are either excluded from the project boundary or will be preserved as green area and, therefore, will not be disturbed by the construction activities.

However, the area, as a flat basin that is subjected to occasional flood, has to be filled up to +6 m Chart datum (CD) to be above the recorded flood level.

Changes and impacts to the topography during the construction are expected to be quite small. Soil piling on the project area will be careful about soil erosion and collapse

### 6.2.1.4 Surface Water and Sediment

This section contains surface water and sediment evaluation of potential impact during construction and operation periods.

Two waterways will be receiving treated wastewater from the Initial Township area:

- Dawei River, which is the primary river in the area flowing from north to south at the foothills of Thanintharyi mountain range and entering into the Andaman Sea at the Thanintharyi Coast Region. The Dawei River is situated at the project boundary to the east
- Kunchaung River (Kyaning Chaung), which is located at the southeastern part of the project boundary. It is a combination of many canals in the north: Sin Pu Nit Chaung; Pein Shaung; and Ya Laing Chaung, flowing from north to southeast and into Dawei River. Kunchuang River will be the primary receiving water, where treated wastewater starts flowing into the canal (near Min Dut Village) which is in the Southern part of the project with the distance of 5 kilometers before flowing rapidly into Dawei River, the secondary receiving water.

Water quality results from various studies indicated that existing water quality prior to the project implementation in Dawei River and Kunchaung River are generally suitable for agricultural purpose, and, to an extent, consumption with pretreatment (refer to **Chapter 4** for more detail). However, high levels of suspended solid and turbidity were observed during the dry season, and in some sampling locations, certain pollutants were higher than the levels expected in natural water, such as phenol, manganese, zinc, copper, lead, and nickel.

Additional water quality monitoring in Dawei River before the project implementation is recommended so that a longer term water quality data are available, and attempt should be made to identify possible sources of these contaminants, potentially from upstream of the project area.

### Construction Phase

Source of pollutants that may impact water quality during construction period include: domestic wastewater from workers and sediment from runoff, particularly in the land development activities where vegetation clearing is needed.

The land development of the Initial Township area, may result in increased sedimentation in surface water from surface runoff in rainy season. Control of sedimentation from the construction sites will be required during the period to reduce release of sediment to the waterways. Vegetation clearing will only be conducted to the area that is needed for construction activities. Control measures such as sedimentation pond and silt fence will need to be constructed to reduce sediment loading to the natural waterways. Potential impacts due to sediment during construction will be limited to only the construction period. Local villagers rely on surface water for agricultural purpose, and water for consumption is sourced from shallow groundwater well. Therefore, impacts to the use of water are expected to be quite limited and short-term.

Domestic wastewater generated from the construction work camps are another source of pollutants to the waterways. Approximately 29.68 m<sup>3</sup>/day of domestic wastewater from the main construction camp is estimated, based on an assumption that the wastewater is generated at the rate of 80 liter/person with a total numbers of workers at 371 persons in the camp (The accommodation is expected to support a maximum of 371 worker employed by Italian-Thai Development Plc., the main construction contractor of Initial Township). Toilets in these camps will be provided with septic and seepage tanks. The location of these tanks will need to be at least 100 m from natural waterways and above expected flood level in the area.

Other concerns may be wastewater and used oil from equipment maintenance and workshops. Used oil will need to be controlled and accounted for. It is recommended that the used oil are kept temporarily on site in a proper storage area until appropriate oil disposal facilities are identified locally or until the waste management facilities of the industrial estate is constructed and operational. Storage of oil and chemical used during the construction period needs to be properly constructed with secondary containment to reduce the impact in case of leakage or spills.

#### **6.2.1.5 Groundwater**

Groundwater is one of the major sources of water supply in the adjacent areas and also exploiting for the project construction activities. There are two locations of using groundwater from water wells for domestic use, Payadat Village located in the northwest part of the project area is exploiting groundwater from existing water wells nearby the proposed solid waste storage. The second village is Pan Din In Village located in the southwest part of the project area.

According to Chapter 5 groundwater quality of the existing wells within the project area can be observed as the following issues:

- Groundwater within this area contains relatively high Total Dissolved Solids, TDS (less than 25 to 2,720 ppm, GW1, 2, 3, 4, 5, 6 and 7). Groundwater at locations of GW4, 5, 6 and 7 is slightly brackish. This may be due to the aquifer that is situated in the coastal area.

- All locations show relatively low pH (4.7 to 6.2). Groundwater is slightly acidity. This may be due to these areas that are underlain by high mineralization.
- Moreover some relatively medium to high contents of cadmium and zinc in stations GW4 to GW7.

The values above provide background concentrations in the groundwater prior to the project implementation. The project activity that may result in impact to groundwater quality is the waste management facilities where sanitary and secured landfills are located. Groundwater monitoring program will be required particularly for the waste management facilities. Considering that the project location is a low-lying land surrounded by mountain ranges and that the hydrogeological gradient is likely to be drained into the coastal area and is unlikely to be connected with groundwater system of the resettled communities, when the project is fully developed, the impact to groundwater use is considered limited. The raw water resource for Initial Township in the full development phase is small water reservoir (Pa Yain Byu). Project activities will not use groundwater and effluent will be discharged through public drainage system without discharge through public water resource. Therefore, the project operation phase will not impact on groundwater quality.

#### **6.2.1.6 Solid Waste**

##### *(a) Non-Hazardous Waste*

Non-hazardous waste generated from the construction work camps. Approximately 371 kg/day of non-hazardous waste from the main construction camp is estimated, based on an assumption that the non-hazardous waste is generated at the rate of 1 kg/person/day with a total numbers of workers at 371 persons in the camp (The accommodation is expected to support a maximum of 371 worker employed by Italian-Thai Development Plc., the main construction contractor of Initial Township). The waste will be appropriated with disposal. The disposal of non-hazardous waste is to use the service of Initial Industrial Estate landfill. There is suitable management system and no discharge through Dawei River.

##### *(b) Hazardous Waste*

Hazardous waste generated from the construction work camps such as used oil, waste paints, machinery lubricants and other items that may have inseparable hazardous constituents. The amount of hazardous wastes could be estimated at 3% of Municipal Waste, the amount of hazardous waste was estimated at about 11.13 kg/day. The disposal of hazardous waste is to use the service of Industrial Estate landfill. There is suitable management system and no discharge through Dawei River.

#### **6.2.1.7 Geology and Seismology**

According to the review of baseline information (Chapter 4), the project area located in Zone 1, minor damage, which is the range of ground acceleration less than 0.075 g, which is equivalent to MMI class V and less. Also, the seismic records indicated that none of earthquake situation in Dawei and project area. Although the risk is considered low, the project may consider cooperating with the local authority in updating and exchange of the seismological information.

## **6.2.2 Biological Components**

### **6.2.2.1 Surface Water Biology**

The surface runoff will increase sediment into the surface water resources. This will result in increased levels of turbidity and suspended solids affecting photosynthesis of phytoplankton and productivity of water resources. Mitigation measures controlling release of sediment from construction sites need to be implemented to limit the amount of sediment being released to the environment.

Wastewater from construction work camps, if not controlled, may result in degradation of water quality and dissolved oxygen, particularly in smaller streams, resulting in loss of or reduced aquatic life. Appropriate primary treatment of domestic wastewater and sewage is required to prevent this impact. Use of seepage tanks and selection of location of the tanks away from the natural waterways will help reduce the potential impacts.

Used oil from equipment maintenance and workshops may be effected to aquatic organism. Used oil will need to be controlled and accounted for. It is recommended that the used oil are kept temporarily on site in a proper storage area until appropriate oil disposal facilities are identified locally or until the waste management facilities of the township is constructed and operational, will help reduce the potential impacts to aquatic life.

### **6.2.2.2 Terrestrial Ecology**

The natural forests in the area designated for Initial Township have long been encroached by local population and used as farmlands and villages. However, from a site observation, mangrove forest, beach forest, dry evergreen forest, and dry Dipterocarp forest still exist in many parts of the area.

Wildlife found in the Initial Township project area in the previous studies are mostly common. The project area is mostly disturbed by human activities and does not offer good feeding ground and habitats.

During construction phase, clearing of vegetation for construction of Initial Township will be required. The situation is unavoidable, but impacts can be reduced through mitigation measures.

Although wildlife in the project area may not be of a major concern, hunting of wildlife inside and outside the project area needs to be prohibited.

## **6.2.3 Economic Development**

### **6.2.3.1 Infrastructure Facilities**

Infrastructure facilities include water supply, electricity, and solid waste management system in the area and if these facilities will be affected by the project activities during construction and operation phases.

Local villagers rely on shallow groundwater wells as source of water for general use and consumption. Electricity is generated from diesel generators located in each village. Solid waste management system is not well established in the area yet and open burn or dumping is still being used.

During construction, groundwater will be the source of water for construction camps. Electricity in the camps will be generated either by diesel generators or the LNG power plant installed during first phase of Industries Phase. No impact to the existing water use and electricity generation of the local villagers is expected.

As there is no adequate solid waste management system in Dawei or near project area. Waste generated during the construction of the project will need to be classified into hazardous and non-hazardous waste. Unless appropriate management facilities are identified, hazardous waste needs to be stored temporarily until the waste management facilities are operational. Disposal site for non-hazardous waste to be used during construction phase needs to be established.

### 6.2.3.2 Traffic and Transportation

Issues related to volume and management of traffic and transportation are mainly covered under EIAs for Main Road and Trans-border Road Link. However, there is one aspect that may need to be addressed within the scope of this EIA, the existing use of local roads through the project area by local villagers.

The existing villages inside the Dawei Industrial area rely on 2 main roads traversing the Dawei Industrial area in a north-south direction. One road is on the west side of the Dawei Industrial area connecting the area to the north of the Dawei Industrial area (i.e. Bawah) to the south (i.e. Maungmagan). This road crosses the Main Road at about Km+4.000. Another route is on the east part of the Dawei Industrial area starting from Yebyu on the southeast of the Dawei Industrial area to the north and crosses the Main Road at approximately Km +15.000.

Transportation of construction materials within the project area is the main traffic volume during this stage. Transportation of construction materials such as cement, rebar, architectural materials (doors and windows), and other materials that cannot be sourced from within Myanmar will be imported from Thailand. The main transportation route from the Small Port connects with the Main Road at approximately Km+3.000 and does not cross any permanent villages.

However, the volume of traffic from smaller vehicles, such as pick-up trucks, is expected to be higher than the period before the project, thus increased risk of accident between the vehicles used in the project and motorcycles, which is the most common transportation mean of the local villagers.

To reduce the risk of accidents, the project will install sign boards along the roads that most frequently used by the project's vehicles. Line of sight and curvature of the road will be progressively improved.

### 6.2.3.3 Land Use

Major concerns related to land use during construction period include:

- Forest encroachment by relocated villagers.
- Temporary services for constructions their crews will initially formed and later turn into uncontrolled settlement, forest encroachment.
- At the stage of project preparation, one of the major task will be land acquisition and relocation of villagers in the project area.

When construction starts, there will be a large number of personnel moving in. The majority will be construction crews with low wages. They will likely depends in part on the locals to provide certain low cost basic services, such as food, cleaning, transportation and especially those entertainment or relaxation not allowed on the official construction camps. Naturally there will be temporary structures set up to provide such services at the place most convenient to the clients, predictably nearest to the main route, crew camps and the entrance to the site, due to the limited mobility and road access of the crews in such early stage. These squatted temporary settlements will overtime take more permanent forms but not necessary

are tidy, safe, or sanitary. While designated township zone is already provided under the proposed plan, the legitimate area for labor services may not be located according to the zone due to convenient distance to the camps and construction sites. In terms of land use, it is important such temporary service activities and structures set up for workers' needs be planned out monitored regularly. Relocation may be needed in intervals as appropriate so that eventually most or all services for project personnel will not be allowed to scatter outside the designated township zone.

## **6.2.4 Social and Cultural Components**

### **6.2.4.1 Socio-Economic Conditions**

Occupations of the local villagers are farmers with basic education from local schools. The concerns of the villagers collected during public consultation activities, apart from concerns regarding compensation and resettlement which are addressed in Public Involvement and Disclosure which is mentions in **chapter 9** of this report and Resettlement Action Plan (RAP) conducted separately, include:

- Lack of knowledge of project activities and planning; and

Another social aspect that needs to be considered is potential conflict between the local populations and immigrant workers particularly due to different culture, language, way of life, and way of thinking.

Influx of construction workers from different culture and nationalities will start from this construction phase. These immigrant workers may unknowingly offend social norms and customs. Potential impacts due to this issue can range from slight to possible widespread creating conflicts between different nationalities inside the project area. To minimize the potential impacts, foreign workers need to receive orientation regarding appropriate / inappropriate actions. A guide, in form of booklet, may be provided to each of the new workers.

Lack of knowledge of project activity and planning is one of the key concerns received from the public consultation activities. This may lead to negative rumors and misconception of the project. The project will need to be proactive and engage the local villagers routinely throughout the preparation and construction phase to ensure that the information is sufficiently disseminated to the villagers. This will also help promote the relationship and trust between the project and the villagers. Concerns of the public can also be collected and addressed during this routine engagement.

The Dawei Special Economic Zone Law requires that the factories employ Myanmar at a certain percentage of all workforces every year. Despite this requirement, if the knowledge and skills of local villagers do not meet the requirements of the industries, the industries will have to employ Myanmar from other regions such as from Yangon resulting in lost opportunity for the local populations. Career training and workshop aiming to improve skills of local populations need to be established to prepare them for future employment in the industrial estate since the construction phase.

### **6.2.4.2 Sites of Historical and Cultural Importance**

Buddhism is the religion of the majority of the populations in the project area. Each of the villages has at least 1 temple. The temple is the center of the community and the senior monks are highly respected by the villagers. Pagodas have been observed to be scattered in various places in the project area, and sometimes in the middle of paddy fields. There are three sites of high historical and cultural values to the local villagers, which are Nabule Settawyar or Buddha Foot Print (Laeshaung Village), the monastery (Mudu Village), and

Pagodas (Min Dut). These sites are within the project area and will require careful planning as to how they are maintained or relocated.

Religious places are highly important in Myanmar and potential impacts due to mishandling of these sites and insufficient engagement and acceptance with local villagers and authorities are considered high.

Sites of cultural and historical importance have to be surveyed, recorded, and clearly marked on project maps. Construction activities that may generate vibration such as pile driving may need to be avoided close to the site unless permission from the local villagers is granted.

Procedure when the construction crews encounter a potential site with historical and cultural values not surveyed or included in the list needs to be established. The construction activities at the site will need to be temporarily suspended, and authorities will be contacted for direction.

#### **6.2.4.3 Public and Occupational Health**

Public and occupation health impact assessment is prepared for the following objectives.

- 1) To identify health hazards of both workers and communities relating to the major activities of the construction.
- 2) To propose mitigation measures and monitoring programs in order to minimize or prevent the adverse effects possibly caused by the project.

Potential sources of impact to public and occupational health conditions during construction phase can be identified as follow:

- Construction activities usually consist of civil works, mechanical and electrical services, and support services. Accidents and injuries are frequently occurred during these activities.
- The construction materials, such as concrete, structural steel, pipe, machinery and other associated infrastructure items, are to be delivered to the site by trucks and vans via temporary unpaved roads. An increasing of transportations may increase accidents and injuries.
- The influx of workforces and the employment of foreign labors, including skilled and unskilled labors. Moreover, growth of other supporting industries and surrounding areas would create pressure on adequacy of infrastructure amenities and services, public health facilities as well as sanitation.
- Increase of accommodation for workers.
- Emission of air pollution, noise, wastewater, and solid waste into environment inappropriately will contaminate ambient environment and may affect health and living conditions of communities.
- Chemicals, chemical and hazardous waste, in case of accidents, may create major hazards such as fire, explosion or chemical leakages.

Potential impacts during construction phase under each important aspect are discussed below:

*(a) Occupational Health and Safety*

Accidents and Injuries:

During the construction phase, accidents and injuries will be notable for workers, especially among untrained ones. The wide range of injuries may be found from minor or medical aid required only to serious cases, disabling injuries and/or death. Faulty electrical devices, blunt injuries, cut wounds, falling, as well as eye irritation and burns are common, however, broken limbs, trauma and or serious injuries can also occur. Besides, increased number of traffic accidents can be expected. Therefore, the prevention and mitigation measures need to be provided.

Occupational, Sexual Transmission and Communicable Diseases:

Potential respiratory diseases may be aggravated, due to pollutants exposure in the workplace, such as dust, exhaust gas, chemicals or solvents. Underlying chronic diseases: asthma, allergy, peptic ulcer, or mental disorder, can be exacerbated by the exposure of hazardous/chemical wastes. Moreover, noise vibration and workplace temperature are likely to be expected. Workers will experience new jobs, hard work and an unfamiliar environment. Hence, they may encounter stress, anxiety, and hypertension. Being away from home, workers easily turn to drink more alcoholic beverages, smoking and/or substance abuse.

Moreover, unhygienic habits, poor personal hygiene and environmental sanitation, may possibly increase diarrhea, hepatitis and communicable diseases. Malaria and dengue fever and local disease from the affected area, can be easily spread. Sexually transmitted disease and HIVs are also expected and needed to be seriously concerned to designate prevention and control measures.

Emergency Response and First-Aid:

Fire may occur from ignition of flammable materials or other reactive chemicals which can lead to accident and injuries as well as loss of properties. Thus, emergency response plan dealing with fire, explosion and chemicals leaks should be established.

Dawei Residence (Myanmar); DRC, as the project owner, has provided the first-aid unit in the campsite at all times. However, when the construction phase is at full scale with some activities at remote sites, additional first-aid units with comprehensive and appropriate equipment should be provided as appropriate. The qualified first-aid units should also be established to ensure that can properly handle with serious or trauma cases. Patients should be taken care and transferred to appropriate medical facilities in time.

*(b) Community Health*

The project activities during the construction phase possibly have certain impacts beyond the project boundaries. Communities around the project area may be affected in various issues.

Housing and Sanitation:

Even though Dawei Residence ( Myanmar ) ; DRC has provided adequate accommodations for the construction workforce, increasing of numbers of workers and also growth of other supporting industries and surrounding areas, possibly numerous accommodations will be constructed outside the estate. This will create pressure on public health services, public health facilities, and sanitation. Currently the public health services provided by local authorities are rather limited. Improper management of sewage, wastewater

and solid waste may generate sources of diseases. Therefore, the sufficient infrastructure amenities and services should be provided, e.g. solid waste disposal, to mitigate the impact.

#### Environmental/Communicable Diseases:

According to construction activities and transportations, communities will be exposed to excessive dust and noise that can lead to increase of respiratory diseases and nuisances.

Due to mobility of workforce, sexually transmitted diseases, such as HIV/AIDS, will be the most concerned communicable diseases. These diseases can be spread widely. Increasing of malaria, dengue fever, dysentery, hepatitis, pneumonia, and tuberculosis is also expected due to the poor sanitation.

The migrated workers may bring emerging diseases to the project area. If this happens, local villagers will be likely exposed to new strains of diseases. Common cold and flu as well as respiratory tract infection caused by probably new strains are also possible. An increase of alcoholic drinking, smoking and substance abuse and increasing of migrated labors, violence and social disturbance are expected as well. Appropriate mitigation measures should be implemented to reduce these impacts that may occur.

#### Accident/Fire/Chemical Leaks:

Unsafe vehicle transport with poor road conditions can trigger vehicle accidents and injuries, particularly among young adults. Accidents may occur while transporting construction materials and supplies including chemicals such as gasoline, solvents or lubricants. These accidents will lead to releases of hazardous materials that may result in fire, explosion and/or toxic chemical leaks into the environment. Thus, the emergency response plan should be established.

#### Adequacy and Readiness of Healthcare Services:

Local healthcare services and healthcare personnel, in quantitative and potentiality dimension are quite limited at present. However, the injuries and illness will be increased in term of quantity and complexity. The mitigation measures should be, therefore, provided to reduce pressure on the healthcare facilities.

## **6.3 OPERATIONAL PHASE**

### **6.3.1 Physical Components**

#### **6.3.1.1 Air Quality**

##### *(a) Air Emission*

During operation period, the activity that may create air pollution is exhaust from vehicles in transportation of residents and commercial. Increase of population that will live and work in the Township may impair air quality especially traffic. However, according to baseline air quality, all parameters are still much lower than air quality standard. So, there still has a range of carrying capacity for air emission.

Air pollutant suppression methods, such as planting trees around the boundary at ground floor, will be required to increase shady area and reduce heat including the CO<sub>2</sub> absorption to reduce pollutants from exhaust.

(b) Greenhouse Gases Emission

As an international concerned issue increasing of greenhouse gases (GHGs) will result in global warming and climate changes. Its consequences now are devastation for environment such as raising of temperature, sea level change, impacts to ecosystem and biota. Although, the Republic Union of Myanmar is not in Annex I (non-Annex I) countries and no need to commit with targets emission of GHGs, according to the Kyoto Protocol (1995), the union has been aware of the threatening and plan to join activities of the United Nations Framework Convention on Climate Change (UNFCCC) in the near future. So far, GHG emission is advised by the MONREC (official comment on 11<sup>th</sup> March 2015 and 2<sup>nd</sup> February 2016 meeting) to instigate Eco-Township for all new establishment.

Operation of the Township such as transportation of residents and commercial by mobile vehicles will emit a level of Greenhouse Gases (GHGs), from exhaust. GHGs from transportation are Carbon monoxide (CO), Non-Methane (CH<sub>4</sub>), Organic compounds (VOCs), Oxides of nitrate (NO<sub>x</sub>) and Sulphur dioxide (SO<sub>2</sub>). Estimate total amount of GHGs will depend on number of population and their transportation activities, their choices of fuel and condition of their vehicles. These factors will contribute CO<sub>2</sub> level in the air and may include traffic condition. Rate of CO<sub>2</sub> emission and the other non-CO<sub>2</sub> are presented in **Table 6.3-1**.

**Table 6.3-1 Estimated carbon emission factors from CO<sub>2</sub> and Non-CO<sub>2</sub> groups in transportation**

Type of Fuels		CO <sub>2</sub> Carbon Emission Factor (tC/TJ)	Non-CO <sub>2</sub> Carbon Emission Factor (tC/TJ)
1.	NGV	17	15.3
2.	LPG		
3.	Ron 91	19	18.9
4.	Ron 95		
6.	E 20		
7.	E 85		
9.	HSD	20	20.2
10.	LSD		
11.	Palm diesel	*	19.3
12.	B5		

Remark: \* No data

Source: US 40CFR Part 98, subparts HH and TT

Another source of GHGs is from wastewater treatment system. As the project has onsite treatment unit, to treat wastewater for each building. The effluent from these units will be collected and treated in the polishing ponds (tanks) with aeration when the BOD has reached the set level (see **Chapter 4, Section 4.1.7**). Major GHG from the system are CH<sub>4</sub> methane. NO<sub>x</sub> Nitrous Oxides is probably a minority. Amount of GHGs emission from wastewater treatment system will depend on specification of the activated sludge tank such as BOD<sub>5</sub> and TNK of the influent, efficiency of the facilities i.e. aerated tank (>95%), size and operation hours of the tank.

When GHGs are required, evaluation of GHGs needs to be re-assessed due to certain number of population, number and specification of equipment / instrument / facilities are required in determination.

**Table 6.3-2 Default values for Methane collection and biomass yield for wastewater treatment system**

Treatment System	MCF <sup>a</sup>	λ
<b>Wastewater Treatment Processes</b>		
Aerated treatment process (e.g., activated sludge system), well managed	0	0.65 <sup>b</sup>
Aerated treatment process, overloaded (anoxic areas)	0.3	0.45 <sup>b,c</sup>
Anaerobic treatment process (e.g., anaerobic reactor)	0.8	0.1 <sup>c,d</sup>
Facultative lagoon, shallow (< 2 m deep)	0.2	0
Facultative lagoon, deep (≥ 2 m deep)	0.8	0
<b>Sludge Treatment Processes</b>		
Aerobic sludge digestion	0	Use λ from wastewater treatment process
Anaerobic sludge digestion	0.8	

Source: US 40CFR Part 98, subparts HH and TT

### 6.3.1.2 Noise and Vibration

The operation phase of residential building that needs quietness has no activities creating noise and vibration. Therefore, the operation of Initial Township has no noise and vibration impacts on nearby area.

### 6.3.1.3 Topography and Soil

After construction finished, impacts to topographic and soil has no impact in operation phase.

### 6.3.1.4 Surface Water and Sediment

An evaluation of potential impacts during the operation period is wastewater from domestic consumption. Estimated wastewater volume in onsite wastewater treatment plant at each building and polishing ponds is followed. Wastewater treatment plant is separated into 2 zones i.e. north zone and south zone. At the north zone, wastewater per building generated from building with capacity as 15 m<sup>3</sup>/day (150 m<sup>3</sup>/day from 10 buildings) is prepared for treated wastewater from 3-floor workforce apartment, 84 m<sup>3</sup>/day (1,512 m<sup>3</sup>/day from 18 buildings) is prepared for treated wastewater from 5-floor workforce apartment and 27 m<sup>3</sup>/day (162 m<sup>3</sup>/day from 6 buildings) is prepared for treated wastewater from 8-floor serviced apartment. Total wastewater volume from north zone is 1,824 m<sup>3</sup>/day. At the south zone, wastewater per building generated from building with capacity as 15 m<sup>3</sup>/day (780 m<sup>3</sup>/day from 52 buildings) is prepared for treated wastewater from 3-floor workforce apartment and 84 m<sup>3</sup>/day (13,272 m<sup>3</sup>/day from 158 buildings) is prepared for treated wastewater from 5-floor workforce apartment. Total wastewater volume from south zone is 14,052 m<sup>3</sup>/day. BOD of effluent will be not exceed 20 mg/l complied with the notification of the Ministry of Natural Resources and Environment in the topic of wastewater standard from wastewater treatment of community. Effluent will be discharged to public drain and through Dawei River. Therefore, the project operation phase will not generate the pollutant to impact on surface water quality.

However, before starting the initial phase of Initial Township, there will be construction of 9 buildings (5-storey) and 1 building (8-storey) for project's workers and officials respectively (It means 9+1 phase that the details are shown in **Chapter 4**), impact on water resources is also less than impact of full phase operation due to less capacity or less population (maximum 700 persons/building in 5-storey building and maximum 222 persons in 8-storey building). Discharge point is Kunchang River only.

### 6.3.1.5 Solid Waste

Solid waste generated during the operation period can be divided into 3 parts i.e., non-hazardous waste, hazardous waste and infectious waste. Non-hazardous waste and hazardous waste will be appropriated with disposal. The disposal of non-hazardous waste and hazardous waste is to use the service of Initial Industrial Estate landfill. For infectious waste is transferred to incinerator for disposal. There is suitable management system and no discharge through Dawei River.

#### (a) Non-Hazardous Waste

Maximum non-hazardous waste from Initial Industrial Estate and Township is 255.34 ton/day and 126.67 ton/day, respectively. Total is 382.01 ton/day. In the first 15 years of operation, non-hazardous waste will be disposed by sanitary landfill. And in year 16-50 (full phases in 50 years), it will be disposed by non-hazardous waste incinerator of Industrial Estate. Its capacity of 2-incinerator is 200 ton/day. Ash from incinerators will be disposed by landfill. Volume of waste whole 50 years is 2,257,631.36 m<sup>3</sup>. There are 9 ponds in the sanitary landfill that can support 2,311,893 m<sup>3</sup> of waste. This capacity is sufficient to support.

#### (b) Hazardous Waste

Maximum hazardous waste from Initial Industrial Estate and Township is 13.44 ton/day and 3.92 ton/day, respectively. Total is 17.36 ton/day. In the first 15 years of operation, hazardous waste will be disposed by secure landfill. And in year 16-50 (full phases in 50 years), it will be disposed by hazardous waste incinerator of Industrial Estate. Its capacity of incinerator is 20 ton/day. Ash from incinerators will be disposed by landfill. Volume of waste whole 50 years is 311,033.24 m<sup>3</sup>. There are 2 ponds in the sanitary landfill that can support 336,700 m<sup>3</sup> of waste.

#### (c) Infectious waste

Maximum volume of infectious waste from Township is 0.042ton/day. It will be transferred to incinerator for disposal with suitable disposal.

## 6.3.2 Biological Resources

### 6.3.2.1 Surface Water Biology

Freshwater biology can be affected mainly from release of wastewater into the receiving waterways or the sea. Wastewater from the project area, if not properly treated, is expected to contain high organic matters, which will affect the living organisms and also the quality of their habitats. However, treated wastewater will be discharged through public drainage system without discharge through public water resource. Therefore, the project operation will not create impact on surface water quality and freshwater aquatic organisms.

### **6.3.2.2 Terrestrial Ecology**

Direct impacts to terrestrial ecology during operation phase are expected to be small as the environment would have been altered since the construction phase.

Due to influx of workers to the industrial area and live in Initial Township, demand of wildlife meat and parts may be increased resulting escalation of wildlife poaching and hunting in more futile reserved forests elsewhere. Education and discouragement of consumption and domestication of wildlife need to be conducted all through the project life.

### **6.3.3 Economic Development**

#### **6.3.3.1 Infrastructure Facilities**

During operation phase, sources of raw water will be from small water reservoir (Pa Yain Byu and Talaing Gya Weir). The raw water will be delivered to the water treatment plant located near the reservoir before delivered to Initial Township.

Electricity will be generated by the power plants inside the industrial estate. The electricity demand for 8 floor serviced apartment and 5 floor workforce apartments is 9,036 and 37,800 VA respectively.

A waste management facility is planned near Township area. The waste management facility will be capable of handling both hazardous and non-hazardous waste (SEATEC, 2012a). Environmental monitoring program will be in place at the waste management facility to monitor if the environmental protection measures at the site is efficient. Waste from Initial Township will disposal at waste management facility in Township

Overall, it is expected that there will be no impacts from the project to the existing infrastructure facilities of the local communities.

#### **6.3.3.2 Traffic and Transportation**

Dawei Industrial Estate Main Road at KM 18.5 is starting point enters to the Initial Township. The current design of Initial Township, when fully developed, incorporates zoning and control of access of vehicles. According to the shape of project area, the Initial Township grid system has been designed into fan-shaped grids with multiple town accesses which will prevent traffic congestion at one access

For the workforce areas, the grids are equally divided the blocks into walking distance to make sure the workers can get off the bus and continue walking to their homes conveniently. In the gated type community such serviced apartments, there will be only one or two accesses to increase both privacy and safety to residents. Public lighting and drainage system will be applied along the grid.

Overall, it is expected that there will be no impacts from the project to the existing traffic and transportation of the local communities.

#### **6.3.3.3 Land Use**

The major concern during operation period is the unplanned land uses that will naturally change to accommodate the livelihood and convenience of those working in the project.

The practice of land use planning in Myanmar is at a very beginning stage. As of present (2013), the government has near absolute authority on land use designation though land use planning practice is still rare. Realizing the need for planning practice, there are efforts from international community in assistance for expertise. The Department of Human

Settlements and Housing Development (DHSHD), Ministry of Construction and UN-Habitat has just announced in press release a launch of a collaborative project on development of guidelines on land use planning.

The strip along the zone designed for township is in a danger of encroachment due to the higher cost of commercial and residential operations to be charged on the designated land which will induce substandard, low-cost shelters and structures outside the boundaries nearby.

Potential negative impacts on land use are predicted to affect the town of Dawei also. As the project is in operation, there will be needs for services other than those day-to-day services that can be provided within the township zone of the project. Naturally, it can be predicted that the town of Dawei, with certain level of infrastructure and social services, will grow rapidly to accommodate requirements of project personals such as, residences for the supervisors or consultants who prefer not to stay within the estate, business clients and guests who visit the project estate shortly for specific purposes, or other workers who perform services to the project personnel but are not allowed to stay in the township zone. Dawei will also provide entertainment activities for the workforces when off-duty on the weekend. These sometimes undesirable uses are not allowed in the township zone of the project but will find their places in the town. Zoning and control for such entertainment district should be laid out ahead of time for the town of Dawei.

#### **6.3.4 Social and Cultural Components**

##### **6.3.4.1 Socio-Economic Conditions**

Issues related to the socio-economic and social issues during operation phase are similar to the construction phase.

Number of apartments including facility designed in the Project has been evaluated, to be enough in term of capacity, space and utilization for sustainable development. Also, growth of the township shall be concurrently developed with growth of the industrial estate for phase by phase. However, over migration of workers and influx of workers from the Tanintaryee region is still concerned because of migration.

For this issue, it shall not be significant problem that will rise from the Project development. This is because most of permanent workers will be sponsored or supported by their plants/factories have been accounted and calculated within this study. They are included in the design and assessment. In addition, most of workers are potentially single workers and the Project has policy to employ local worker who mostly have already had accommodation in the Project vicinity. On the other hand, other type of migrants or influx i.e. dependents of the migrant (family) or temporary or non-sponsors workers or others related business migrants shall be planed and prepared for the FSD by relevant Township agencies.

##### **6.3.4.2 Sites of Historical and Cultural Importance**

If the handling and relocation of historical and cultural places during construction phase is performed properly, potential impacts during operation phase is not expected.

#### **6.3.5 Public and Occupational Health**

Potential sources of impact to public and occupational health conditions during operation phase can be identified as follow

- Most of industries are labor intensive (may live in Township); therefore, numerous workers, including foreign/migrated and untrained workers, are expected.
- DRC has set a plan to provide a township consists of hospital, school and other infrastructure amenities located inside the industrial estate boundary.
- Increase of accommodation and growth of supporting industries in the surrounding areas will create pressure on adequacy of infrastructure amenities, public health services, public health facilities as well as sanitation, especially around the project area.

Potential impacts during operation phase under each important aspect are discussed below:

*(a) Occupational Health and Safety*

Sexual Transmission and Communicable Diseases:

Sexual transmission diseases and vector-borne infection are mostly related to poor personal hygiene and poor sanitation. Foreign or migrated workers who live in Initial Township are possibly exposed to local diseases, malaria and dengue fever. Strict prevention and control measures as well as health care promote for living.

Adequacy and Readiness of Healthcare Services:

Regarding the significant numbers of workers in the project area, a hospital/healthcare facility located in the project township will be established. This newly established healthcare facility should be the comprehensive one, in term of adequacy, capability, and accessibility since at present public health facilities and services provided by local authorities are quite limited.

*(b) Community Health*

*(1) Sanitation:*

Increasing of supporting industries and surrounding areas will have pressure on adequacy of infrastructure amenities and services, as well as public health facilities. Improper management of sewage, wastewater and solid waste may lead to poor sanitation and environmental health stresses. Currently, public health services of the local authorities are limited therefore the project owner should closely collaborate with the local authorities to create the mitigation measures to prevent the consequences that may occur.

*(2) Environmental, Communicable/Non-Communicable Diseases:*

Spread to the local residents, especially in the area with poor hygiene practices. Sexual transmission diseases, HIV/AIDs, and communicable diseases are associated with mobility of workers.

Higher public incomes may result in unhealthy habits e.g., low nutritious food, alcohol drinking and less exercise, which may cause chronic health problems: hypertension, diabetes, heart disease, stroke and cancers. More alcohol consumptions and smoking will be normally found. In fact, these non-communicable diseases will be serious problems, and need a sophisticated approach for the solution.

**Table 6.3-3 Types of Negative Impacts on Project**

No.	Construction Phase	No.	Operation Phase
1.	Accidents/Injuries	1	Sexual Transmission and Communicable Diseases
2.	Occupational, Sexual Transmission and Communicable Diseases	2	Adequacy and Readiness of Healthcare Services
3.	Emergency Response and First-Aid		

Source: UAE (2016)

**Table 6.3-4 Types of Negative Impacts on Communities**

No.	Construction Phase	No.	Operation Phase
1.	Housing and Sanitation	1.	Sanitation
2.	Environmental and Communicable diseases	2.	Environmental/ and Communicable/Non-Communicable Diseases
3.	Accidents/Fire/Chemical Leaks	3.	Adequacy and Readiness of Healthcare Services.
4.	Adequacy and Readiness of Healthcare Services		

Source: UAE (2016)

*(3) Adequacy and Readiness of Healthcare Services:*

Qualified healthcare services are needed due to an increase of illness, injuries, accidents and fatalities. The wide range of injuries and disabilities will create an excessive burden of health services. Consequently, the effective health surveillance system is needed.

The potential impacts of worker and public during construction and operation phases can be concluded as shown in **Table 6.3-3** and **Table 6.3-4**.

The Project plan to have a 60 beds hospital equipped with medical treatment and facilities, details in Chapter 4, *Section 4.1.2.4*. This size of hospital is estimated to be enough for size of population that will reside in Township.

**6.3.6 Natural Disaster**

Lately, frequent natural disaster, cyclone, flooding, fire and earthquake have been frequently reported, which raise a concern for new establishment in order to protect people life and properties in accordance with Myanmar Action Plan on Disaster Risk Reduction (MAPDRR). Disaster assessment and Emergency Response Plan is required in ESIA. The issue is mentioned by 2<sup>nd</sup> and 3<sup>rd</sup> of MONREC comments. Thus, three threatening disaster in the Project region are assessed in this section.

**6.3.6.1 Flooding**

Base on physical resource in **Chapter 5, Section 5.2**, location of the Project is in monsoon and in warm and humid climate. In accord with flooding map with return period of 100 years, annual flood may not often expose the Project to flooding because the Project is located in upstream area, not regular flooding area, downstream of both Kun Chuang and Dawei Rivers (See **Figure 4.1-33**).

Periodical cyclone, has started frequent occurring for the past decades and recently impacted Myanmar many times, especially in Ayeyarwaddy river delta region. As location of the Project in Tanintharyi region that is not in direction of the cyclone, so, it is situated in low risk area. However, the storm is regional meteorological condition, the Project area may still be under the storm influence. Heavy and continuous rainfall may prone risk of rapid flooding in local including cumulative flooding in regional area. Thus, the Project has designed the Flood Controlling System (**Chapter 4, Section 4.2.4**) that can effectively drain runoff and can insist up to 140 mm/hour of rainfall or approximately 4 hours of flood retention times.

To ensure that the Project will be minimal impacted by storm and flood hazards, The Project shall follow the Flood Emergency Response Procedure as prescribed in **Section 4.1.10.3.**

### 6.3.6.2 Earthquake and Tsunami

Base on physical resource in **Chapter 5, Section 5.2**, Location of the Project (See **Figure 5.2.7**) is in active zone of earthquake, around 500 km from subduction or collision boundary between Indian and Eurasian Plate margins. However, this is a deep earthquake, around 150 to 200 km below the ground and may not expose damages to the Project unless, a regional to global scale of earthquake will occur, which will be consequently an unavoidable disaster.

In the contrary, attention shall pay to intra- plate movement, active fault. “*The Sagaing Fault*” is the major fault that cause severe damages and ruins, as recorded in long history of the Union of Myanmar (See **Figure 5.2.8** and **Table 5.2-1**). Because the fault is still active, shallow earthquake (less than 50 km), frequent occur and expose on land in northern Myanmar. The Sagaing Fault is N-S trending, from Sagaing region downward to Yangon region before submerges under the Andaman sea. It system are such as normal faults and the Andaman spreading ridges. Location of the Project is around 300 km east from the trend and overlays on passive earth, detritus sediments/sedimentary rocks of Quaternary, the Project shall be expose low risk. However, the Project may associate earthquake for a level depending on scale and magnitude of regional earthquake, the scale may ranging from feelable to some damages on structure.

According to, seismic zoning map prepared by Tint Lwin Swe (2012) as presented in **Figure 5.2-7**.and **Table 6.3-5** suggested that hazard from earthquake is moderate. At the present, risk is still low due to exposure to number of population. It shall be higher risk when number of population and structures are increased.

**Table 6.3-5 Probable earthquake and tsunami hazards along coastal areas of Myanmar (Thein et. al., 2011)**

Coastal Region	Area	Earthquake Hazard	Tsunami Hazard
Rakhine Coast	Northern part	Strong Zone with MMI 8	Moderate
	Southern part	Moderate Zone with MMI 7	Moderate
Delta Area	Ayeyawady Delta	Moderate Zone with MMI 7	Moderate
	Sittoung Estuary	Severe Zone with MMI 8–9	Moderate
Taninthayi Coast	Northern part	Moderate Zone with MMI 7	Moderate
	Southern part	Moderate Zone with MMI 7	Light

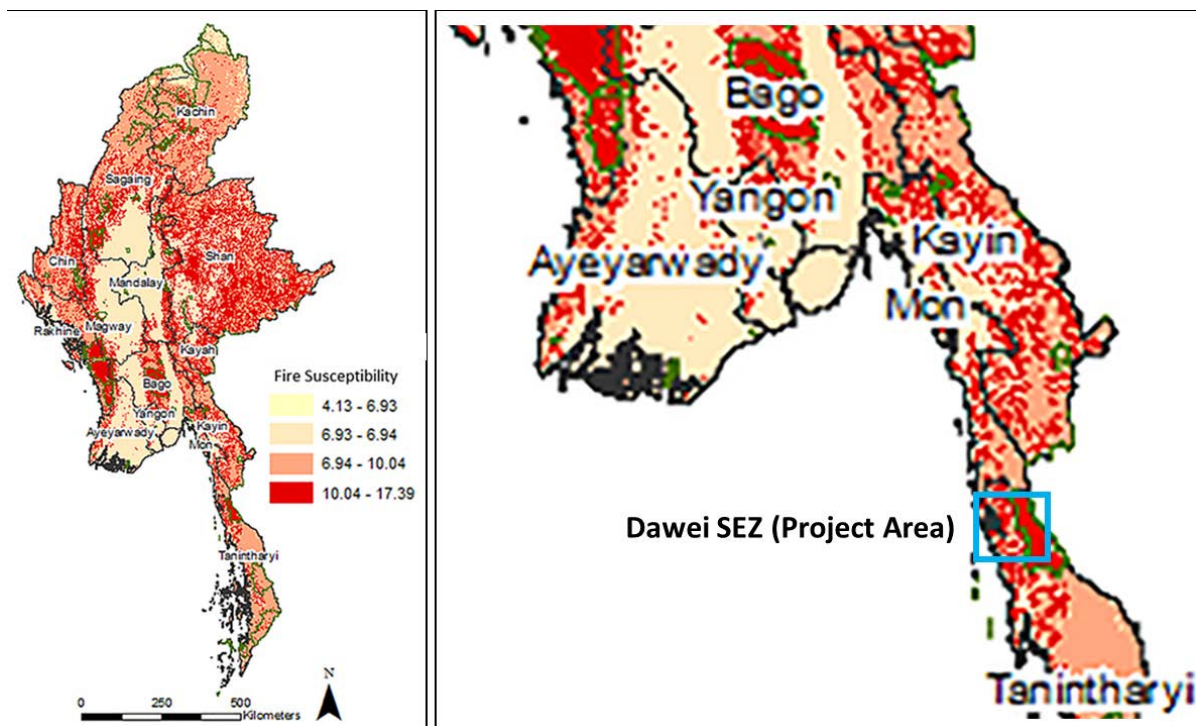

Source: Thein et.al. (2015)

The Project may associate tsunami for a level depending on scale and magnitude of the sub-marine earthquakes that originates in Indian Ocean. However, due to setting of the Project location is not on shoreline, which is in low tsunamic impact zone and as reported in Myanmar, none of wave are exceeding 3 meters (Thein et. al, 2011 and Satake et. al., 2006). At least 10 km further in landward, the Project shall not be directly wiped off by this height of Tsunami (Refer to the worst Tsunami, case with maximum 60 meters height, hit the Andaman shoreline in December 2004). The Project shall be in low risk from Tsunami.

In this EIA report, ERP will not include the earthquake and tsunami emergency because likelihood of occurrence is low and temporary. In case unavoidable disaster i.e. regional or global scale, the Project and related people shall follow general procedure for evacuation and safety guideline in responding to Earthquake and Tsunami ;[http://www.earthquakecountry.org/downloads/LivingonShakyGround\\_NorthCoast.pdf](http://www.earthquakecountry.org/downloads/LivingonShakyGround_NorthCoast.pdf) (Annex 6-1).

### 6.3.6.3 Fire Vegetation

Fire prone research, probabilistic frequency ratio analysis of fire vegetation, by Biswas et.al. (2015) <http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0124346> reveals that anthropogenic sources contributes fire risk factor rather than biophysical factor e.g. vegetation, elevation and temperature. Area in vicinity of the Project, around 20-50 km in radius, has high exposure to fire vegetation, as presented in **Figure 6.3-1**. Fire vegetation in Project area likely causes by agriculture burns including shifting burns of land and crops. Northeast of the Project area, is protected forest, has also high risk of fire due to type of vegetation and elevation. It can be source of fire vegetation by spreading. Especially, in dry month between November and April, fire is more prone by winds and fuels rather than in wet month where humidity is limited ignition of fire. For this reason, the Project is located in high fire hazard areas due to it surrounded with settlement of people and protected forest; the impact from fire vegetation is medium.

Source: Biswas et.al. (2015)

**Figure 6.3-1 Fire risk map**

To ensure that the Project will be minimal impacted by fire vegetation, the Project shall follow the Fire Emergency Response Procedure as prescribed in *Section 4.3.2* and mitigation measures as follow:

- Manage fire defending space area surround the Industrial Estate i.e. location connect to plantation
- Vegetation for buffer zone shall not be ignitable plant species e.g. Eucalyptus are among flammable plants.
- Manage vegetation, weeds, organics rubbish by other mechanical ways instead of burning. In case necessity, open burning must not leave over or ignorance. The burning must be controllable.
- Engage community, to acknowledge villagers about hazard of fire vegetation, reduce burning and fire prevention plan.

## **6.4 RISK ASSESSMENT**

### **6.4.1 Conceptual Framework**

#### **A. Concept and Definition of Environmental Risk**

In most documents on environmental risk assessment, environmental risk is narrowly defined to focus on a hazard from an environmental event which could affect receptors through an environmental pathway. For example:

- environmental event: Disposal of toxic and hazardous wastes on land causing soil contamination which could pollute groundwater
- Environmental pathway: groundwater
- Consequences on receptors: health impacts on communities nearby the disposal site that rely on groundwater for domestic use and consumption

In these environmental risk assessment documents, impacts are easily confused with risks if the risk context is not clearly established. In the above example, if toxic and hazardous waste are not properly disposed off in the site, soil will be contaminated and pollutants could reach the aquifer. If the disposal site is on the aquifer used by the communities, it is certain that the groundwater will be polluted causing adverse consequences on the communities. In this respect, groundwater pollution is certain and the issue needs to be investigated in the context of EIA not environmental risk assessment. On the contrary, if the wastes are properly disposed in engineered landfill, there still is a concern that the liner may possibly leak. This concern is a risk that should be investigated in the context of environmental risk management and will have to be managed to minimize the possibility of leak.

The consultant considers environmental risk within the context and framework of project risk management as environmental risk is one of several categories of project risks, such as technical risk, financial risk, legal risk, and market risk. Environmental risk will need to be managed as part of project risk management, which is an integral part of project management, during the construction phase and the operational phase of a project in parallel with other categories of project risks.

A project risk is variously defined in risk management document but all definitions share three key word: event, likelihood of occurrence of event, and consequence of the event, if occurred, on the project. The Consultant defines a project risk in general as:

*“A project risk is an undesirable event which may or may not occur, but if it occurs it will have negative consequences on the achievement of project objectives.”*

In investigating environmental risk of this project, the consultant, base on the above definition of a project risk, treats an environmental risk as:

*“An event which may or may not occur, but if it occurs it will have negative consequences on the achievement of the project’s environmental management objectives, i.e. Compliance with environmental performance requirement prescribed by Dawei Residence Company Limited (DRC) and other authorities.”*

## **B. Objectives of Environmental Risk Assessment**

In line with the objectives of EIA, the objectives of environmental risk assessment (ERA) are to: (i.) identify and assess environmental risk during the construction and operational phases of the project; and (ii) prepare an environmental risk management plan (ERMP) for the project covering the construction phase (CERMP) and the operational phase (OERMP). The ERMP will be part of the project risk management plan (PRMP) to be implemented as part of project management.

## **C. Environmental Risk Management Planning Process**

The ERM planning process is similar in principle to the project risk management planning process, and the planning process for the construction phase is similar to that for the operation phase. The project risk management planning is different from the environmental risk management planning in scope and risk management context.

The ERM planning process adopted for this project, in general, consists of the following steps:

### **(1) Establish the Environmental Risk Management Context**

The establishment of environmental risk management context is to gain a clear understanding of the following subjects: (i) project management arrangements, especially project risk management; (ii) arrangements for environmental management of the project during the construction phase; (iii) responsibilities of contractors, project owner, project management team, and supervision consultants; and (iv) linkage between environmental risk management and project risk management, and between environmental risk management and environmental management.

Information on the project implementation and its environmental impacts will be the basis for forming judgmental views on the potential uncertain events which constitute risks, likelihood of occurrence of the events, and their impacts on the environmental management objectives of the project.

### **(2) Risk Identification**

Risk identification is to identify various concerns related to possible events that, if occur, could result in the project being unable to comply with environmental requirements prescribed by DRC and other authorities. Such events would consist of external events and internal event.

### **(3) Risk Analysis**

In this step, each identified event will be analyzed to come up with a rational conclusion on its likelihood of occurrence (high, medium, low), its impacts on the achievement of the project’s environmental management objectives and direct and indirect on-site and off-site costs, and causative factors related to the occurrence of the event.

(4) Risk Classification

The results of risk analysis are used to prepare a risk classification matrix based on the likelihood of occurrence and the magnitude of impact. **Figure 6.4-1** shows an example of a simple risk classification matrix. In this example, risks are classified into minor, moderate and major risk.

- Minor risks are characterized by low impact and low likelihood of occurrence. Minor risks can be accepted or ignored.
- Moderate risks are characterized by high impact and low likelihood of occurrence or by low impact and high likelihood of occurrence. Moderate risks will need treatment.
- Major risks are characterized by high impact and high likelihood of occurrence. Major risks will need close attention of the management and significant levels of treatment.

<b>Level of Impacts</b>	<b>Serious to Catastrophic</b>	<b>Moderate Risk</b>		
	<b>Significant</b>	<b>Minor Risk</b>		
	<b>Insignificant</b>			
		<b>Low</b>	<b>Medium</b>	<b>High</b>

**Likelihood of Occurrence**  
**Simple Risk Classification Matrix**

Source: Modified from the matrix in NASA Risk Management Presentation

**Figure 6.4-1 Simple Risk Matrix**

A risk profile should be prepared for each risk to be managed. The risk profile should include:

- A description of the risk;
- Potential cause of the risk;
- Likelihood of the risk occurring;
- Potential effect or consequences of the risk;
- Ranking or severity of the risk; and
- The evaluation of the acceptability of the risk.

(5) Formulation of Cost Effective Risk Treatment or Mitigation Measures

For a risk related to uncontrollable external event, such as flooding, risk mitigation measures will either aim at protection or minimizing the impacts or both.

For a risk related to internal event, the risk mitigation measure to be adopted could be designed to reduce the likelihood of occurrence, reduce consequences if the event occurs; avoid the event by not taking actions that have risks; and transfer the risk. A minor risk

would be accepted if the mitigation measure is not financially justified. Designing a cost effective mitigation measure needs to consider the root cause of the event constituting the risk.

#### (6) Arrangements for Implementing and Managing the Risk Mitigation Measures

This step will propose arrangements for implementing the proposed risk mitigation measures, including: (i) responsible person for each risk; (ii) organization for environmental risk management; (iii) risk monitoring and evaluation; and (iv) reporting and corrective actions.

The environmental risk management plan will need to be linked with the environmental management plan as well as the project risk management plan to ensure that any dependencies or potential resource conflicts between project and environmental management tasks and environmental risk mitigation are identified and resolved. Managing environmental risk is essentially an element of project risk management. For example, the individual environmental risks will need to be included in the project risk registration process.

### 6.4.2 Environmental Risk Management-Construction Phase

#### A. Environmental Risk Management Context

For this project, the ITD contractor would be contractually responsible for: (i) preparation of detailed designs and specifications of all equipment and facilities; and (ii) procurement and construction. The environmental performance requirements of the project construction and operation will need to be adequately incorporated in the designs, specifications, and construction. All environmental mitigation measures recommended in this Final EIA Report and accepted by the DRC will be implemented by his subcontractors under the supervision of construction supervision consultants of project proponent. Monitoring of the environmental performance of the ITD contractor will be carried out by the project management team of project proponent.

The environmental risk management will be carried out by the project management team as part of the overall project risk management. The environmental risk mitigation measures will be implemented by the project management team within the scope of and procedures for project risk management.

#### B. Risk Identification

During the construction phase, uncertain events or environmental risk would be of concern to the project proponent is the project may not be able to comply with environmental requirements prescribed by DRC or other concerned authorities.

This uncertain event could have the following consequences on the project:

- The authorities may order the project to suspend the construction or in the worst case they may revoke the construction permit.
- Physical damages or body damages on-site or off-site with cost to be incurred by the project.

#### C. Risk Analysis

The identified risk events could be cause by the following:

**Risk: Failure to comply with the environmental requirements**

**Potential causes:**

- The ITD contractor and subcontractor have inadequate understanding of the environmental performance requirements of the project.
- The ITD contractor and subcontractor unintentionally omit the environmental requirements due to ambiguity of the environmental requirements in the contract.
- Inadequate supervision and monitoring of environmental mitigation activities of the ITD contractor and subcontractors.
- Changes in designs or construction methods without revising the originally proposed mitigation measures.
- Change in the environmental requirements during the construction without the revision of the originally proposed mitigation measures.

**D. Risk Classification**

Figure 6.4-2 shows a risk matrix for the construction phase. Risk is considered major risk as it would have a high level of likelihood of occurrence and a high level of impacts.

<b>Level of Impacts</b>			
<b>Serious to Catastrophic</b>			
<b>Significant</b>	<b>Public Opposition to the Project</b>	<b>Failure to comply with the environmental requirements</b>	
<b>Insignificant</b>			
	<b>Low</b>	<b>Medium</b>	<b>High</b>

**Likelihood of Occurrence**  
**Simple Risk Classification Matrix**

Source: Modified from the matrix in NASA Risk Management Presentation

**Figure 6.4-2 Risk Matrix for the Construction Phase**

**E. Risk Mitigation Measures**

Risk mitigation measures need to address the identified causes of the risk. Mitigation measures for the identified risks correspond to the identified causes are presented in **Table 6.4-1**. The measures will be implemented through contractual arrangement.

**Table 6.4-1 Mitigation Measures for Environmental Risk Management during Construction Phase**

Cause	Mitigation Measures
The ITD contractor and subcontractor have inadequate understanding of the environmental performance requirements of the project.	Require the ITD contractor to: <ul style="list-style-type: none"> <li>- Prepare a Construction Phase Environmental Management Plan (CEMP) base on the EIA report and associated CEMP, detailed design and construction plan and schedule. The CEMP must clear define.</li> <li>- The project’s environmental requirements and obligation</li> <li>- Physical measures that are needed to comply with the requirements and obligation.</li> <li>- Construction measures that are needed to comply with the requirements and obligation.</li> <li>- Assignment of responsibilities to each subcontractors.</li> </ul>
The ITD contractor and subcontractor unintentionally omit the environmental requirements due to ambiguity of the environmental requirements in the contract.	<ol style="list-style-type: none"> <li>1. TOR for procurement of the ITD contract must clearly state the project’s environmental requirements during the construction phase that the ITD contractor must ensure that the project construction will meet the requirements.</li> <li>2. The ITD contract must clearly prescribes environmental management responsibility of the ITD contractor.</li> </ol>
Inadequate supervision and monitoring of environmental mitigation activities of the ITD contractor and subcontractors.	<ol style="list-style-type: none"> <li>1. The supervision consultant will be required to submit a supervision and monitoring plan that clearly indicates the environmental tasks to be supervised and monitored. This supervision and monitoring plan for the implementation of the environmental mitigation measures.</li> <li>2. Monthly reviews of the ITD contractor environmental performance.</li> <li>3. Close supervision of truck operations especially during the site filling period.</li> </ol>
Changes in designs or construction methods without revising the originally proposed mitigation measures.	Changes in designs or construction methods may be initiated by the ITD contractor or the project proponent. The request for changes must be subject to the change procedure in project management. The request for changes must be accommodated by an analysis of environmental implications and revised mitigation measures.
Change in the environmental requirements during the construction without the revision of the originally proposed mitigation measures.	Change in the environmental requirements may be initiated by DRC or the project proponent with approval of DRC. The change must be subject to the change procedure in project management. The ITD contractor will analyze environmental implications of the changes and revise the originally proposed mitigation measures accordingly.

Source: UAE (2016)

## F. Implementation Arrangements

### (1) Responsible Persons and Organization

Environmental risk management needs to be an integral element of environmental management of the project. Therefore, the organization for environmental management proposed in the Construction Phase Environmental Management Plan (CEMP) will also implement the environmental risk mitigation measures in cooperation with the construction supervision manager.

## (2) Risk Monitoring and Evaluation

Risk monitoring involves periodic monitoring of risk triggers. A risk trigger is an event which could lead to the occurrence of the risk event. For example, a risk trigger for a flood risk is the intensity and frequency of rain falls in the catchment area. The rainfall data will be analyzed to evaluate the likelihood of occurrence of flood.

Risk monitoring and evaluation in environmental risk management will be carried out as part of the environmental monitoring program for environmental management. Some data could serve both risk monitoring and environmental monitoring.

### **Risk: Failure to comply with the environmental requirements**

The monitoring and evaluation should cover the following risk trigger:

- Inadequacies of the CEMP prepared by the ITD contractor and the timeliness in correcting deficiencies in the CEMP found by the project management team;
- Trend of the ITD contractor and subcontractors not conform with the construction requirements related to the CEMP; and
- Response of the ITD contractor to the instructions of the supervision engineers and the SHE manager regarding the implementation of environmental impact mitigation measures and monitoring of the environmental management performance.

## (3) Reporting and Corrective Actions

The process for reporting and corrective actions in environmental management will also be applied to the environmental risk management.

### **6.4.3 Environmental Risk Management-Operational Phase**

The operation phase of residential building has no risk activities. Therefore, the operation of Initial Township has no risk impacts on nearby area.

## CHAPTER 7 CUMULATIVE IMPACT ASSESSMENT

### 7.1 INTRODUCTION

Cumulative impacts are the result from incremental changes caused by other past, present, or reasonably foreseeable actions together with the project. The reasonable foreseeable actions are usually obtained from available government policy, town planning and/or development plans that are applicable to the area of interest.

Initial Township is small area located in the east of Dawei Initial Industrial Estate. Dawei Initial Industrial Estate and associated components are by far the single largest development plan in this region of Myanmar. No other town planning or development plans have been identified during the study period. Myanmar also lacks overall economic development planning, which hinders prediction of future cumulative impacts. It is therefore assumed that the future scenario will include expansion of villages and townships surrounding the project area due to expanded local economy and immigrated workers.

For the cumulative impact assessment of the Initial Township project is assessed in overall of Dawei Initial Industrial Estate. It is assessed in case of opening the all operation phase. Past and present development and impacts to the area are from smaller scale human development mainly from agriculture (paddy fields, and orchards) and communities. Mining is one of the key industries in Myanmar, but the locations of mines are generally in the mountain ranges further away from the project area.

Present environmental qualities which can be used to represent past and present impacts, from the baseline and existing environmental surveys in several studies of the project, are in acceptably good conditions except for surface water quality in major rivers, where some parameters such as phenol and COD may occasionally exceed the referenced standard levels. The surveys show that groundwater quality has evidence of being contaminated with wastewater and sewage from communities due to escalated level of coliform bacteria. Terrestrial ecology in the project area has been changed from natural conditions to agricultural lands and communities. The area on the west bank of Dawei River has evidence of being encroached by local populations based on site observation. Marine ecology, however, is still quite diverse most likely due to limited marine fisheries activities in the area and no large scale commercial fishing has been observed.

It is therefore believed that the current activities in the area have already put stress on some of the environmental aspects, particularly on surface water quality, groundwater quality, and terrestrial ecology, in the project area. The present water quality impacts are most likely from lack of sanitary system in the communities within and surrounding the project.

A simple matrix can be used to identify and evaluate cumulative impacts due to project development and other past, present, reasonably foreseeable activities against elements of environment or sensitive receptors. The levels of potential impacts are assessed qualitatively based on available information from the above sections and the best professional judgment. **Table 7.1-1** is shown the results of the evaluation.

Beneficial cumulative impacts are identified in two areas: infrastructure facilities and socio-economic conditions. Although, initially, the Initial Industrial Estate will only install power plant sufficient to sustain the project operation, the Initial Industrial Estate may expand the grids to cover the adjacent communities in the future. This will provide a more stable and reliable electricity source to the current system in the communities that relies on diesel generator.

Adverse cumulative impacts on terrestrial ecology and land use are of the most concern. Although the Initial Industrial Estate area and project area has already been encroached and largely used by local populations, expansion of the communities and population as an indirect impact of the project may increase demand of lands and wildlife products, which will lead into further encroachment into forest area and increased wildlife poachers. Lack of land use and town planning, as discussed in the previous sections, may worsen the situation surrounding the project area.

Moderate impacts are identified for air quality, surface water and sediment, traffic and transportation, and sites of historical and cultural importance.

**Table 7.1-1 Cumulative Impact Evaluation Matrix**

Source: EIA Study Team

Surface water and groundwater quality, as discussed earlier, already show signs of impacts due to the past and present human activities. Wastewater from households and agricultural areas are discharged into receiving waterways, which end up in Dawei River. Only basic sewage treatment system, such as septic and seepage tanks, exists in a few places. Most of the households still use open pits for disposal of sewage. This leads to contamination of groundwater wells, which are being used for consumption. The project has less potential to impact groundwater quality but discharge of treated wastewater will be made to Dawei River. Without improvement to the sanitation system within the communities, which are expected to be expanded in the future, cumulative effects on the quality of surface and groundwater are foreseeable.

The local road network outside the project area is small and in deteriorated conditions. Expansion of the local road networks will be needed to alleviate the potential impacts in the future.

The Industrial Estate has plans for building its own healthcare facilities for construction and operation period. This will reduce stress to the public healthcare facilities outside the project that are already in deficiency, based on the baseline conditions discussed in Chapter 4. An increase of population in local communities is expected, and it is likely that the local healthcare facilities may not be developed quickly enough to cope with the increased in population. However, the increase of population will support the local economic.

Initial Township has established EMP to address some of these concerns, such as for land use issue. However, many of the cumulative impacts and possible mitigation measures are considered to be beyond the scope and capability of the Initial Township to implement. Close cooperation with local and national government agencies will be required to address these concerns and to ensure that the potential impacts are predicted and appropriate measures are planned and implemented.

## CHAPTER 8 ENVIRONMENTAL MANAGEMENT PLAN

For each of the potential environmental impacts described in the previous chapter, measures are suggested either to prevent those impacts or to mitigate their effects. The various preventative mitigation measures proposed for different types of impacts, implementation parties, the responsible authorities, location of usual construction or operation activities, estimated cost and duration are prescribed in this Chapter.

The key organizations responsible for implementation of the mitigation measures include: the Governing Bodies of the Government of Myanmar, the Project Proponent, the Construction Contractor and Sub-Contractors (during construction phase), and the Investors/Tenants. Definition and responsibility of each party are described in **Section 8.6** Institutional Arrangement.

### 8.1 ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN

As enacted in the EIA Procedure, 2015. The two EMPs during construction phase and operation phase are defined as follows:

*“Construction Phase EMP means a detailed and comprehensive Environmental Management Plan (EMP) for the construction phase of a Project. Such plan shall present all relevant commitments, Emission Limit Values, Environmental Quality Standards and other environmental requirements and include a description of the construction works, present an overview of Adverse Impacts, present mitigation measures and monitoring programs together with time schedules, overview maps, images, aerial photos, satellite image, site layout plans, cross sections, transects, environmental management and monitoring sub-plans for each construction site, thematic sub-plans, and management procedures as appropriate.”*

*“Operation Phase EMP mean a detailed and comprehensive EMP for the operational phase of a Project. Such plan shall present all relevant commitments, Emission Limit Values, Environmental Quality Standards and other environmental requirements and include a description of the construction works, present an overview of Adverse Impacts, present mitigation measures and monitoring programs together with time schedules, overview maps, images, aerial photos, satellite image, site layout plans, cross sections, transects, environmental management and monitoring sub-plans for each construction site, thematic sub-plans, and management procedures as appropriate.”*

The above definitions make clear that the two EMPs required by MONREC will need to be comprehensive and have more details than very brief EMPs presented in EIA reports of the past. This requirement of MONREC is in line with current ESIA practices in developed countries. It should be noted that the two EMPs prepared as part of this ESIA study are invariably framework plans as they are based on outline designs of the Project. They are therefore intended to provide framework and prescribe requirements for the preparation of

detailed CEMP and OEMP by the appointed EPC contractor (Contractor). Consequently, they could be considered and referred to as the Project Proponent's or Owner's EMPs to distinguish them from the Contractor's EMP after the ESIA during project implementation.

## **8.2 EMP AND EMoP FOR CONSTRUCTION PHASE**

As discussed in Chapter 6, the Project is not expected to have major environmental impacts during construction apart from environmental disturbances normally experienced in Township construction. Nevertheless, the Project Proponent will ensure that the Contractor will make best efforts to minimize the impacts during the construction phase despite their insignificant levels. In this regard, the Project Proponent will ensure that the Contractor-CEMP will incorporate all mitigation measures as prescribed in the Owner-CEMP in preparing detailed designs of the township and its associated facilities, construction methods, and specifications. CEMP is present as below:

### **8.2.1 Erosion and Sedimentation Action Plan**

#### *(a) Principle and Rational*

Construction and earth-moving activities accelerate erosion mainly by exposing areas of soil to rain and running water. If this runoff is not properly controlled, the result is often serious siltation of nearby watercourses. The consequences are degradation or destruction of fish and wildlife habitat, and water being less useful for freshwater supplies.

#### *(b) Objectives*

To prevent soil erosion in the construction site into water resource and area nearby.

#### *(c) Project Area*

Project construction area

#### *(d) Description of Mitigation Measures*

CC shall prepare the Erosion and Sediment Control Plan for construction activities and submit to DRC for approval prior to commencement of construction activities in the area. The major effort at construction sites will focus on the management of erosion of excavated surfaces, especially during the wet season when the volume of runoff is expected to be high. The plan shall have the following components:

- An assessment of the potential for contamination of natural waterways. Basic principles include the size of the disturbed area, site drainage, and waterways receiving storm water from the disturbed area;

- Plans for water management during construction shall be established and include adequate drainage system to manage runoff from 2-year ARI storm flow;
- Sedimentation controls shall be implemented in the form of silt trap fences and sedimentation basins where appropriate, and all runoff from the disturbed area shall be directed to the sediment controls;
- Measures to be taken to collect, store and treat storm water prior to discharge from the site considering options for water re-use onsite;
- Management of material storage area – Stockpile and spoil disposal area shall not be located on drainage line;

Control of erosion and sedimentation shall be constructed progressively prior to commencement of each stage of earthworks until the permanent protection is established.

*(e) Description of Monitoring Program*

DRC shall develop a monitoring program to include inspections of drainage works, sediment traps and other structures designed to treat water to reach an acceptable quality before discharge into natural and/or constructed watercourses meet the appropriate standard. The monitoring program for erosion and sediment control include:

- Inspect that erosion and sediment controls are in place prior to wet season,
- Inspect that the drainage system and sediment controls are functional during wet season,
- The sediment basins have a capacity of reducing the suspended solid from storm water by fifty percent (50%),
- Designate water quality monitoring plan to include locations of sampling upstream and downstream of the entry points of surface water runoff from construction area; frequency and methods of testing, and applicable standards for suspended solid.

A total of 6 sediment sampling stations similar to those surveyed during baseline sampling is recommended. Details of the stations and parameters are provided in Figure 8.2-1 and Table 8.2-1 but in 9+1 phase (details are shown in **Chapter 4**) only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored

*(f) Work Plan (Duration)*

During construction period

*(g) Responsible Organizations or Agency*

CC under supervision by DRC shall develop and implement *Erosion and Sediment Control Plan* according to the site condition and progress of construction work.

DRC shall review and approve the *Erosion and Sediment Control Plan* before the construction in the area can be commenced, then inspect and monitor the implementation of *Erosion and Sediment Control Plan* according to the monitoring program. DRC shall prepare the report with the result of the implementation to MC every 6 months.

(h) *Budget*

Included in construction budget.

## 8.2.2 **Surface Water and Sediment Quality and Aquatic Biology Action Plan**

(a) *Principle and Rational*

Release of pollutants from construction activities, work camps, workshops, and chemical storage to the environment may affect quality of freshwater, coastal water, and sediment. Control of release is necessary to limit the potential impacts caused by such activities.

(b) *Objectives*

- To prevent soil erosion and wastewater runoff into natural water resources.
- To prevent wastewater contamination from campsite

(c) *Project Area*

Project construction area

(d) *Description of Mitigation Measures*

The following mitigation measures need to be implemented by DRC and CC:

- Prepare and implement the measures for Erosion and Sediment Control.
- Prepare and implement the measures for Waste Management.
- Prepare and implement the measures for Construction Work Camps.
- Release of oil and grease from workshop facilities is prohibited. Used oil need to be stored separately and managed as per Waste Management Plan.
- Stock yards; gasoline, oil, lubricant and hydraulic oil storage areas; and machines/vehicles cleaning areas should be located at least 100 meters away from natural waterways.
- Sedimentation pond or settling pond or sediment trap shall be implemented.

(e) *Description of Monitoring Program*

Integrate monitoring program for inspection of mitigation measure implementation with relevant plans.

Additionally, it is recommended that the project continue sampling of surface water quality in Dawei River and Yalaib Chaung every 6 months, before and after rainy season, during the construction period for another 3 years so that the project has a more complete and continual baseline surface water quality before commencement of the Initial Township area.

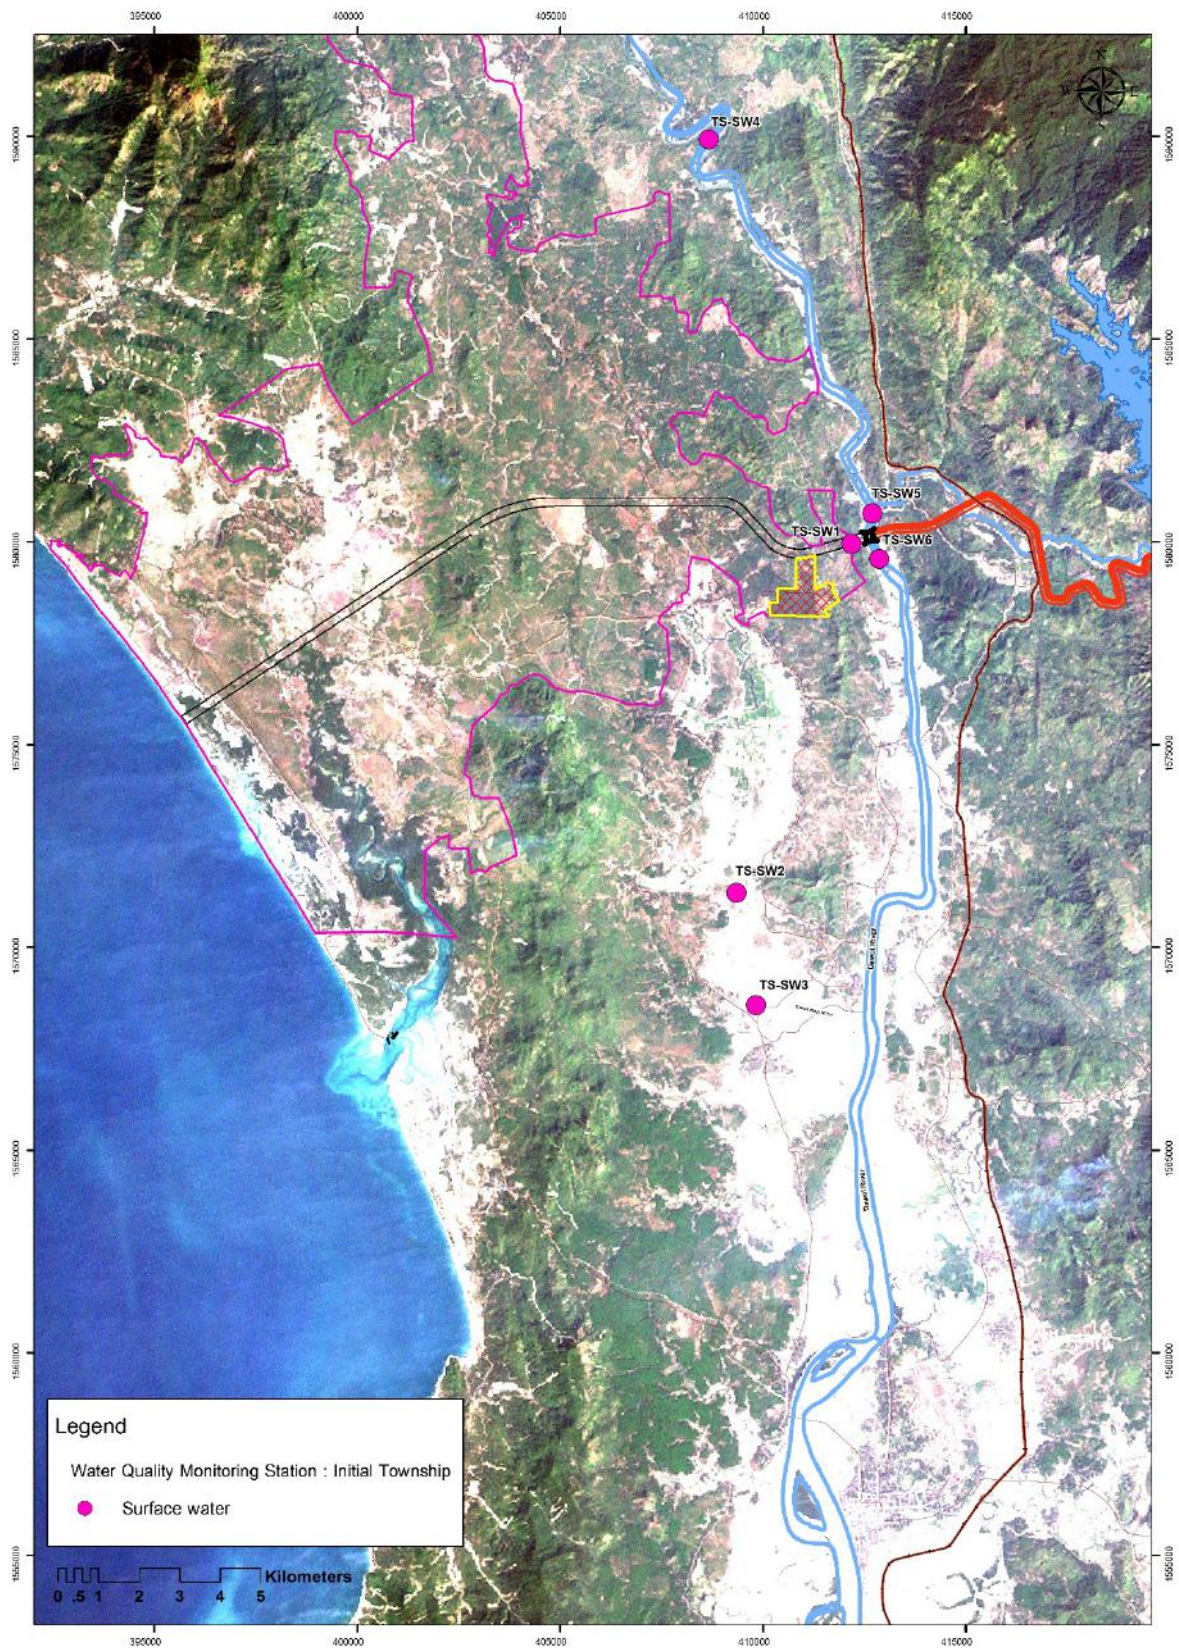

In Full phase, a total of 6 sampling stations similar to those surveyed during baseline sampling is recommended. Details of the stations and parameters are provided in Table 8.2-1 and Figure 8.2-1 but in 9+1 phase (details are shown in **Chapter 4**) only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored.

**Table 8.2-1 Analysis Methods of Surface Water and Sediment Quality Parameters and Sampling Stations During Construction Period**

Parameters	Analysis Method <sup>1/</sup>	Sampling Station
<b>Surface Water</b>		
Depth/ Width	Depth Meter	TS-SW1: Discharge point at the north of the project at KM 18-500 TS-SW2: Upstream at Yalai Chaung at meeting point of Yalai Chaung and canal(that receiving wastewater from discharge point at south of the project) TS-SW3: Downstream at Yalai Chaung at meeting point of Yalai Chaung and canal(that receiving wastewater from discharge point at south of the project) TS-SW4: Dawei River at the boundary of the project area at Ta Nyin In village TS-SW5: Dawei River (at about 500 meters upstream from the Yang Gaeng bridge) TS-SW6: Dawei River (at about 500 meters downstream from the Yang Gaeng bridge)

**Figure 8.2-1 Sampling Locations for Surface Water, Sediment and Aquatic Biology Monitoring in Construction Phase**

(f) *Work Plan (Duration)*

During construction period

(g) *Responsible Organizations or Agency*

Refer to the relevant plan.

(h) *Budget*

Approximately 48,000 USD/Year

### **8.2.3 Terrestrial Biology Action Plan**

(a) *Principle and Rational*

Although the much of the project area has been encroached by local villagers and used as farmland and residential areas. Attempts should be made to conserve the native plant species and minimize disturbance to sensitive environment.

(b) *Objectives*

To prevent a natural forests, endangered plant species, native plant species and minimize disturbance to sensitive environment such as mangrove area.

(c) *Project Area*

Project construction area and surrounding area

(d) *Description of Mitigation Measures*

DRC needs to coordinate with CC to ensure that the measures below are incorporated in their construction plan.

- Only clear the area needed for construction of infrastructure and utility system. Avoid disturbance of forest and mangrove areas as much as possible.
- Wherever possible, identify the endangered species and transfer them to safe locations prior to clearing the vegetation.
- Hunting of wildlife is prohibited.
- Disturbance of forest areas outside the project area by CC and their subcontractors is prohibited.

(e) *Description of Monitoring Program*

DRC will be monitoring the progress of construction work and vegetation clearing. Excessive vegetation clearing particularly prior to rainy season has to be minimized. Natural forests and mangrove areas that can be conserved throughout the construction phase has to be identified and signposted

*(f) Work Plan (Duration)*

Vegetation clearing plan and detailed survey of endangered species has to be conducted before the area is cleared. The plan can be revisited throughout the construction period.

*(g) Responsible Organizations or Agency*

DRC is responsible to identify the area where natural forest and mangrove can be conserved. DRC needs to consider further survey of endangered plant species identified in baseline environmental survey to map out their locations and numbers. DRC shall communicate the plan to CC for action.

*(h) Budget*

Included in construction budget.

#### **8.2.4 Air Emission and Noise Control Action Plan**

*(a) Principle and Rational*

Main potential impacts to air quality during construction activities are dust from construction areas (land clearing) and unpaved roads. Other sources include exhaust from machineries used in the construction activities. Main potential noise impacts are the diesel engine and pile driving or pavement breaking which may affect nearby communities and receptors.

*(b) Objectives*

To reduce and control dispersion of dust and noise due to construction activity and to reduce air pollution emission and noise from construction machinery equipment. To reduce air pollution and noise impact on community nearby the area.

*(c) Project Area*

Project construction area and surrounding area

*(d) Description of Mitigation Measures*

DRC shall formally notify CC and enforce the following measures to reduce emission of air pollutants and noise from construction activities.

- All equipment and vehicles will need to be maintained in good mechanical conditions;
- Stationary noise sources (such as generators, concrete batching plants, etc) shall be sited as far as possible from villages, construction camps and resettlement areas;

- Construction works within the distance of 500 meters from villages and resettlement areas will be carried out between 06:00 to 18:00;
- Dump trucks with loads that may generate dust will be covered when travelling through communities including limited speed of vehicles to 40 km/hr;
- Water spraying at least once a day in the construction areas and on unpaved roads is required in the following conditions:
  - On the section of unpaved transportation routes that pass through communities or construction work camps;
  - When dust generating activities e.g. alteration of topography are being carried out within 100 meters of a village or construction work camp;
  - When visual inspection indicates excessive dust generation in the construction areas and unpaved roads used for material transportation;
- Burning of waste materials including waste vegetation from site clearing will be allowed under the following conditions:
  - The materials that are allowed to be burned are general garbage and vegetation waste. No burning of materials that may generate toxic gases is allowed;
  - A trained fire protection officer with appropriate firefighting equipment has to be present near the burning areas;
  - Burning is not allowed during severe wind conditions;
  - Burning is carried out at a safe distance from vegetated areas and not within 2 km. from a village, a construction work camp, or resettlement areas on the upwind direction;
- Avoid impact pile-driving where possible in vibration-sensitive areas. Drilled piles or the use of a sonic or vibratory pile driver causes lower vibration levels where the geological conditions permit their use.
- Construction workers exposed to noise levels of 80 dB(A) or more shall be provided with adequate Personal Protective Equipment (PPE) for hearing protection.
- Check complaints/grieves from communities about dust/noise and construction activities. Ensure that the complaints/grieves are settled.

*(e) Description of Monitoring Program*

DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program can be described as follow:

- Each construction machineries are inspected at least every 6 months with a written certificate / maintenance records of each machinery provided by qualified mechanics of the CC;

- Inspect that the dust suppression measures are implemented according to the mitigation measures;
- Inspect that the burning of waste materials are conducted according to the relevant mitigation measures;

Monitor the Community Grievance Record related to dust and noise and ensure that the complaints are responded to and closed appropriately according to the relevant mitigation measures

*(f) Work Plan (Duration)*

During construction phase of the Initial Township.

*(g) Responsible Organizations or Agency*

DRC shall ensure that the mitigation measures were distributed to and acknowledged by CC.

CC shall implement the mitigation measures under supervision of DRC.

DRC shall report the results of implementation to MC every 6 months.

*(h) Budget*

Included in construction budget

### **8.2.5 Waste Management Action Plan**

*(a) Principle and Rational*

A number of elements of the construction activities have the potential to generate waste that can have adverse effects on the surrounding environment in terms of water quality, soil quality, air quality (odor and pollutants) and human health. Waste can be both non-hazardous and hazardous waste. These wastes require different management methods. Lack of appropriate waste management facilities in the vicinity of the project area requires that the project needs to manage the waste generated from the construction activities by themselves.

*(b) Objectives*

- To prevent and resolve waste and solid waste impact from the project.
- To minimize waste and provide guideline for solid waste management according to the law and regulation and appropriate method.
- To prevent and resolve impact from remaining solid waste. To get rid of bleeding area in solid waste storage location.

*(c) Project Area*

Project construction area

(d) *Description of Mitigation Measures*

DRC shall develop *Waste Management Plan* that will be applicable to all contractors in the project. The *Waste Management Plan* shall include the following components:

- Identify classification of waste. The minimum waste classification shall be non-hazardous and hazardous waste;
- Identify the size and location of the temporary hazardous waste storage area and non-hazardous waste disposal site for the construction phase of the initial township;
- A mechanism for coordination between DRC and CC in waste separation, waste transfer and record of waste quantity.
- Hazardous waste shall include, but not limited to, the following waste materials. Any mixed waste stream that contains any of the hazardous waste shall be categorized as hazardous waste:
  - Acids and acid waste;
  - Alkalis and caustic waste;
  - Batteries;
  - Spent catalysts, solvents, and chemicals;
  - Empty containers which held chemicals, paint, oil and solvents;
  - Oil contaminated waste including oily rags, oil filters, used gloves;
  - Used oil, hydraulic fluids, chemicals, and solvents;
  - First aid and medical waste;
  - Spill clean-up waste;
  - Waste from grease trap; and
  - Sludge from chemical wastewater treatment system.
- Hazardous waste shall be stored in appropriate temporary hazardous waste storage areas until the permanent hazardous waste management facilities for the operation phase is functional. Minimum requirements of the temporary hazardous waste storage areas include:
  - Impervious floor without cracks or spaces that may allow spills to perforate into the ground;
  - Surrounded by secondary containment bunds. The secondary containment bunds shall be at least 0.5 m high with a volume large enough to contain the spill of the largest container expected in the storage area;
  - Designate storage area for liquids or materials that are not allowed to be mixed, such as acids and alkalis;
  - Equipped with spill response kits;

- Consider providing the area with roofing and temporary walls with a provision that the temporary hazardous waste storage area will have to be in use for at least 3 years until the permanent hazardous waste management facilities of the initial township are functional.
- Type and quantity of hazardous waste in the storage area shall be recorded and kept up to date.
- Burning of the following non-hazardous waste is allowed: cardboard, pallets, papers, and wood/vegetation waste. The waste burning site shall be designated in the *Waste Management Plan* and shall be at least 2 km from any villages, construction work camps, or resettlement areas.
- Other non-hazardous waste shall be transferred to non-hazardous waste disposal site to be used during construction phase shall meet the following minimum requirements:
  - The disposal site shall be on higher ground not subject to flood.
  - The disposal site shall be at least 2 km from any groundwater well that is being used by workers or local villagers.
  - The disposal site shall be in the area where no excavation is planned. It shall be delineated with clear sign boards.
  - The waste shall be covered with soil on daily basis.
  - The location of all disposal sites during construction period shall be recorded as expanded appendices to the *Waste Management Plan*.
- Establish a training program for workers related to waste classification, storage and disposal.
- The *Waste Management Plan* may be expanded to cover recyclable waste and compostable waste in the future.

(e) *Description of Monitoring Program*

DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program is described below.

- Inspect that appropriate containers for type of waste as categorized in the Waste Management Plan are provided for construction work camps, workshops, construction sites and other supporting facilities;
- Weekly inspection of waste segregation at the construction facilities and at the hazardous waste storage and non-hazardous waste disposal site;
- Weekly inspection of hazardous waste storage area and record of hazardous waste inventory.
- The location of waste burning area is designated and no waste burning is conducted outside the area;

- Waste management training record;

(f) *Work Plan (Duration)*

During construction phase of the initial township

(g) *Responsible Organizations or Agency*

DRC shall develop the *Waste Management Plan* to be implemented by both DRC and CC during construction phase.

DRC shall operate the temporary hazardous waste storage area and waste disposal site. DRC shall keep record of types and quantity of waste received to the temporary hazardous waste storage area and non-hazardous waste disposal site. DRC shall provide and keep record of waste management training program. DRC shall report the implementation of Waste Management Plan to MC every 6 months.

CC shall collect, separate, and transport the waste to the appropriate waste handling facility. CC to designate waste burning area.

(h) *Budget*

Included in construction budget.

## **8.2.6 On-site Traffic and Access Management Action Plan**

(a) *Principle and Rational*

Access roads used for transportation of construction materials and for traveling between construction sites overlap with the existing roads used by local villagers inside the project area. Roads are currently unpaved and have blind spots. Improvement of road safety conditions will be required.

(b) *Objectives*

To control using for transportation of construction materials and for traveling between construction sites

(c) *Project Area*

Project construction area and surrounding area

(d) *Description of Mitigation Measures*

DRC as the project owner shall be responsible and instruct relevant CC to implement the following measures to improve access road safety conditions.

- All access roads in the construction area shall be signposted with the following information in Myanmar and English:

- Speed limit;
  - Construction activities and machinery;
  - Roadside borrow pits and material stockpiles;
  - Any applicable load limit, particularly for temporary bridges; and
  - Road features that may affect driving conditions such as curves, hidden accesses etc.
- A speed limit of 40 km/hr shall be applied in village areas and construction camps. Drivers shall be trained and notified of such limit;
  - Consider building speed humps before and after each village, where appropriate;
  - Route for heavy vehicles used for transportation of construction materials shall be designated. Route with least number of villages and residential area is most preferable;
  - Survey of the access roads to identify blind spots need to be regularly conducted. Improvement to the blind spots such as removal of obstructing objects when necessary; and
  - Access road used for the construction activities shall be maintained in good conditions.

*(e) Description of Monitoring Program*

DRC is responsible for monitoring the above measures implemented by all parties. DRC shall coordinate with CC in selection of the most appropriate transportation routes that will contribute to least impact to the locals using the road for their daily travel;

*(f) Work Plan (Duration)*

During construction phase of the township, until the permanent roads are completed

*(g) Responsible Organizations or Agency*

CC responsible for construction and maintenance of the access roads shall be responsible for implementing the measures relevant to signposts and road improvement.

DRC and CC are responsible for using the designate routes for transportation of construction materials and traveling between construction sites. Speed limit needs to be respected and punishment system should be in place in case of violation.

*(h) Budget*

Included in construction budget.

## 8.2.7 Construction Work Camps Action Plan

### (a) Principle and Rational

Construction work camps can be sources of wastewater pollution and health impacts. Thousands of workers are expected during the construction period, and proper management of the camps will be required to ensure that the potential impacts are controlled.

### (b) Objectives

To control sources of wastewater pollution and health impacts from work camps.

### (c) Project Area

Project construction area

### (d) Description of Mitigation Measures

It is assumed that DRC, CC and subcontractors will have their own compounds and camp management bodies. The following measures will be required for each of the worker camps in the project area:

- Camp rules shall be established and informed to all residences. The rules should contain the following components:
  - Policy on alcohol and substance abuse;
  - Safety measures and emergency response particularly in case of fire;
  - Waste management requirements;
  - Other measures to prevent dissemination of vectors and transmissible disease including STDs and HIV/AIDs;
- General areas of the camp shall be kept clean and tidy. Waste shall be collected regularly to avoid accumulation of waste in the camp;
- Toilets shall be provided at a ratio as 1 toilet per 15 workers. All toilets shall be equipped with septic and seepage tanks of adequate size. The toilets need to be at least 100 meters from any natural waterways. Sludge from tank cleaning shall be stabilized by adding lime (pH = 12 for 30 minutes) and disposed of in designated pit for sludge disposal. The pit shall be at least 1 kilometer from any groundwater wells
- Proper drainage has to be provided. Improve areas with stagnant water as much as possible; and
- Pest control measures shall be planned and implemented. All bedrooms need to be equipped with mosquito protection.

*(e) Description of Monitoring Program*

DRC shall be the party inspecting the camps periodically to ensure that all the implementation are made

*(f) Work Plan (Duration)*

Since the start of any construction work camp until end of its use

*(g) Responsible Organizations or Agency*

All parties are responsible for managing their own camps in line with the above mitigation measures

*(h) Budget*

Included in construction budget.

### **8.2.8 Historical and Cultural Resources Action Plan**

*(a) Principle and Rational*

There are a number of sites with historical and cultural values in the project area. Each village also has at least one temple. Pagodas are observed in many places nearby the project area. Construction activities may disturb and damage these structures. Removal or relocation of these sites will be eventually required when the project is fully developed. If not handled properly, this matter will create significant conflict between local populations and the project.

*(b) Objectives*

To reduce disturbing and damaging historical and cultural values in the project area.

*(c) Project Area*

Project construction area and surrounding area

*(d) Description of Mitigation Measures*

DRC as the project owner will need to take ultimate responsibility in handling the matter and ensure that CC understand the risk and follow the procedures and measures described below to reduce potential impacts with the communities.

- Sites with historical and cultural values shall be identified, recorded and located in the map. This information shall be agreed upon by the local authorities and villagers.
- Inform ward/village administrator if ancients or antiques objects have been found. Relocation/remove must be consulted with local communities.

- If construction activities have to be carried out within 50 meters from these sites, the leaders of the communities that the sites belong to need to be notified at least 1 week prior to commencement of the activities.
- Establish a plan and communication channel in case an unidentified site is encountered during the construction work to avoid damage to the site.
- Removal and relocation method and destination shall be a mutual agreement between DRC, local authorities, and the leader of the communities that the site belongs to.

*(e) Description of Monitoring Program*

DRC needs to keep record and map up to date and make them available to all parties including CC and their subcontractors. DRC needs to monitor the construction work progress with the locations of known sites so that timely action can be taken if the sites will be subject to disturbance by construction activities

*(f) Work Plan (Duration)*

All through the construction phase

*(g) Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

*(h) Budget*

Included in construction budget

### **8.2.9 Public and Occupational Health Action Plan**

*(a) Principle and Rational*

Construction activities can directly and indirectly affect the conditions of public and occupational health. Potential impacts include accidents, injuries, communicable diseases, increase in stress to the existing public health facilities, etc. Mitigation measures related to each aspect of public and occupational health are described below.

*(b) Objectives*

To reduce accidents, injuries, communicable diseases, increase in stress to the existing public health facilities

*(c) Project Area*

Project construction area

*(d) Description of Mitigation Measures*

Occupational Health and Safety:

During the construction phase, DRC as the project owner and CC as the implementer should establish the preventive and protective measures to mitigate the potential occupational health impacts as follows:

*Accidents and Injuries*

- Establish occupational and safety management plan and program for the construction should be established to assess and manage EHS impacts and risks. Project or activity-specific plans or procedures should be prepared and the basic site rules of work should be included.
- Perform occupational accidents and disease recording and reporting, and investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.
- Provide contractor management plan to ensure that the contractor will have safety performances and procedures to protect their employee. Supervise and monitor contractor performance periodically.
- Train and provide information to employees. Occupational health training program should be provided as needed, for example, hazard awareness, specific hazards and safe work practices, to ensure that workers are capable of work safely.
- Provide appropriate personal protective devices to employee and ensuring that personal protective devices will be worn during working at all time.
- Restrict local community to access the site or area using fencing, signage and risks communication.
- Appropriately mark area signage and labeling of equipment , determine hazardous area for example, electrical rooms, compressor, etc., as well as installations, materials and emergency exits, and label in accordance with international standards, and easily to understand by workers, visitors and general public.

*Occupational, Sexual Transmission and Communicable Diseases*

- Supervise and monitor performance of contractors and sub-contractors on housekeeping in the campsite.
- Include training programs for workers with these following topics: health awareness, hygiene and sanitary, waste management, communicable and transmission diseases, cultural awareness, regulations and compliance, and drug abuse.

- Register foreign or migrated workers should be seriously performed to ensure that these workers have medical and health certificates to guarantee their personal health conditions.
- Conduct surveillance and active screening and treatment of workers. Immunization program may be required.

#### *Emergency Response and First-Aid*

- Establish emergency response plan and procedures which also should be in place for any remote sites. The emergency response plan has to be revise time to time with changes of envi
- Provide appropriate emergency services and personnel to expedite emergency response when needed, maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.
- Provide health services and first-aid unit at all time, with comprehensive and appropriate equipment, establish the qualified the first-aid unit to properly handle with serious or trauma cases, and sufficient to meet the requirements, treat and/or patients to appropriate medical facilities in time.

#### Community Health:

##### *Housing and Sanitation*

- Provide sufficient infrastructure amenities and public health services in the campsite, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment

##### *Environmental/Communicable Diseases:*

- In close collaboration with the community health authorities, implement an integrated control strategy for environmental and occupational diseases, such as integrated vector control programs, eliminating of breeding habitats in the campsite, and eradicating disease reservoirs.
- Collaborate with community health authorities to enhance the worker families to access public health services, and promote immunization.
- Distribute appropriate education materials for example health awareness, sexual transmission disease and communicable disease.

##### *Accidents/Fire/Chemical Leaks*

- Consider the level of local firefighting capacity to identify firefighting equipment that should be available when needed, and provide all necessary equipment with regular maintenance program.

- Communicate potential accidents and/or hazards to local authorities, communities and relevant parties.
- Conduct emergency response practices, including liaison with local response organizations and local responders.
- Revised or/and establish Emergency Response Plans in accordance with recent policy, laws and regulation.

#### *Adequacy and Readiness of Healthcare Services*

- Provide the first aid unit at the campsite for their workers, assess whether the local health service capacity sufficient for worker's family and supporting industries, and in close collaborating with local authorities, consider supporting/additional health service facility.
- Risk and impact to environment from construction of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.

#### *(a) Description of Monitoring Program*

DRC will keep monthly update of health and safety statistics and records. Performance of construction health and safety is monitored against a set benchmark. DRC inspect health and safety conditions of the CC and subcontractor's construction sites and camps periodically

#### *(b) Work Plan (Duration)*

Throughout the construction period

#### *(c) Responsible Organizations or Agency*

DRC or Third party consultant shall ensure that the mitigation measures were distributed to and acknowledged by CC.

CC shall implement the mitigation measures under supervision of DRC.

DRC shall report the results of implementation for audit every 6 months.

#### *(d) Budget*

Included in construction budget.

### **8.2.10 Public Participation and Dissemination**

#### *a) Principle and Rational*

Public participation and information dissemination is apart environmental assessment process and sustainable development that will be result in economic, environmental and social values. General public idea about the project such as concerns of

stakeholders, information and recommendation from public can be gathered through public meetings and social surveys which this information will be considered and can take accounted by DRC for further project management plans.

b) *Objectives*

To inform the stakeholders about the Initial Township project, gain public views, concerns and values, increase public confidence, improve transparency and accountability in the EIA decision-making process.

c) *Project Area / Stakeholders*

Project construction area and impacted area with various level of government agencies, relevant and responsible agencies, project impacted people, media and dependent organizations.

d) *Description of Mitigation Measures*

DRC shall establish public relation and public participation plan to incorporate in requests and recommendation of the continuous engagement of stakeholders following

- Inform about project activities to community
- Support nearby community as appropriate to build good relationship with community
- Communicate to build community understanding about
  - Construction activities and progress
  - Potential environmental impacts and mitigation measures
- Conduct by DRC consistent with the applicable standard for public meeting/consultation
- Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.
- Take account the results of the public consultation in improving and revised the EMPs.

e) *Description of Monitoring Program*

DRC will conduct public meeting or public relation e.g. using questionnaire or attitude survey for communities surrounded the Initial Township Project within 1 km in radius of the project areas. The result must be report and the method must achieve acceptable standard and been carried out with representative samples with confidence statistics.

f) *Work Plan (Duration)*

Once for the entire construction phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in construction budget

### 8.2.11 Grievances Redress

a) *Principle and Rational*

For transparency and performance of the project in dealing with grieves that raise by communities and affected people. Grievance mechanism shall be implemented.

b) *Objectives*

To received grieves and complains from affected people or organization and manage the grieves effectively.

c) *Project Area / Stakeholders*

Project construction area and impacted area with project impacted people or impacted organizations.

d) *Description of Mitigation Measures*

DRC shall establish Grievance Redress Committee and Grievance Redress procedure to address any complaints / grieves to resolve / settle disputes that brought forward by community pertaining to project activities.

e) *Description of Monitoring Program*

Ensure that the grievance redress mechanism has been implemented. Complaints/grieves are systematically recorded and cases are settled.

f) *Work Plan (Duration)*

Once for the entire construction phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsile for this matter

h) *Budget*

Included in construction budget

### 8.3 EMP AND EMOP FOR OPERATION PHASE

The operators refer to the investors build and operate their facilities in the Initial Township. Responsibilities of the operators, which will be during the operating phase, include:

- Comply with environmental requirements of DRC during construction and operation of their facility.

#### 8.3.1 Air and Noise Quality Action Plan

##### (a) Principle and Rational

Main potential impacts to air quality during operation period is exhaust from vehicles.

Noise from operation phase in the residential buildings and township area is similar with cities. It has no noise and vibration impacts.

##### (b) Objectives

To control the main potential impacts to air quality during operation period is exhaust from vehicles and to not exceeding the relevant international standards.

##### (c) Project Area

Project and surrounding area

##### (d) Description of Mitigation Measures

Mitigation measures for air emission and noise can be listed below:

- Provide some space areas for tree planting within the project area.
- Care and maintain the trees planted; in case the trees are dead, shall plant trees to replace the dead ones.
- Install sign to notice that “Do not start the car while parking for waiting” at the parking area and reiterate the security guards to control strictly.
- Limit vehicle speed inside township area as 30 km/hr to mitigate possible noise impacts on nearby area.
- Install the “No Audible” sign within residential and township areas in obvious places.
- Plan for emission of GHGs from the Project shall be established and/or revised in concurrently with the relevant GHGs policy and regulations.

*(e) Description of Monitoring Program*

No monitoring program is required

*(f) Work Plan (Duration)*

Throughout the operation phase

*(g) Responsible Organizations or Agency*

DRC is responsible to comply with the mitigation measures and prepare report and communicate with MC every 6 months.

The township operator is responsible to report the operating results to DRC every 6 months.

*(h) Budget*

Included in operation monitoring budget

### **8.3.2 Waste Management Action Plan**

*(a) Principle and Rational*

Waste generated from township is expected to be non-hazardous waste mainly. However, they can be essentially divided into 2 types: hazardous and non-hazardous waste. Waste management facility of Dawei Industrial Estate is expected to be complete at the same time as commencement of Early Industries Phase 2, which is in 2015-2016. The facility will be able to handle both hazardous and non-hazardous waste. However, prior to the commission of the facility, waste generated from Early Industries Phases will also have to be properly managed to reduce potential impact to the environment.

*(b) Objectives*

To control leakage of waste from landfill site to the ground have potential to affect the quality of ground water and environment

*(c) Project Area*

Project area

*(d) Description of Mitigation Measures*

Nevertheless, the Initial Township will use the waste management facilities together with the Dawei Industrial Estate but the waste management facilities will be completed before the operation phase of the Initial Township.

- Design and construction of the landfill shall be in accordance with Solid Waste Disposal Facility Criteria – Technical Manual published by U.S. EPA (1993) or other applicable standards.

- Detailed hydrogeological condition of the proposed landfill area has to be studied in the design of landfill.
- Groundwater monitoring wells will be installed. As a minimum, 1 well is to be installed up-gradient of the landfill and at least 3 wells is to be installed down-gradient of the landfill. Depth of screens and well construction depends on the results from the hydrogeological condition study.
- The components of the waste management facility: i.e. sanitary landfill, secured landfill and incinerator shall be designed and constructed according to the internationally accepted standards.
- The facility shall create its Standard Operating Procedure covering steps from receiving waste, laboratory analysis, stabilization, temporary storage, incineration and disposal. Audit by third party is necessary.
- The landfill shall be closed daily to prevent vectors and odors.
- Classify hazardous and non-hazardous waste according to the definitions in the Waste Management Plan prepared.
- Workers need to be trained of Waste Management Plan.
- All hazardous and non-hazardous waste generated shall be transferred to the facility for disposal.
- Waste manifest system has to be created and implemented.
- Record of type of waste including its quantity shall be kept in the database of DRC.
- Waste Management Facility (if constructed in the landfill)

*(e) Description of Monitoring Program*

Monitoring of environmental quality around the site is necessary. The monitoring requirements may be divided into each type of environmental matrix as follow:

- Groundwater monitoring:
  - Collect baseline groundwater quality before the operation of the landfill.
  - Monitor groundwater quality every month for the first 6 months and then every 6 months unless unusual concentrations are observed.
  - For the waste management facility where hazardous waste stabilization and disposal is conducted, monitor the following parameters: pH, redox potential, dissolved oxygen, temperature, conductivity, turbidity and metals (cadmium, copper, lead, manganese, nickel, arsenic, selenium, and mercury).

- Compare the results with Thailand's groundwater quality standards or other applicable international standards.

- Runoff and wastewater monitoring

The waste management facility is considered equal to a city area. The same requirements of wastewater management will be applied

*(f) Work Plan (Duration)*

During the operation of the waste management facility

*(g) Responsible Organizations or Agency*

DRC is the party responsible for operating the infrastructure and utility system and thus is the operator of the waste management facilities, both during Early Industries Phases and at full development stage.

*(h) Budget*

Approximately 2,300 USD/year

### **8.3.3 Water and Sediment Quality Action Plan**

*(a) Principle and Rational*

Discharge of wastewater and release of waste materials to the receiving water have potential to affect the quality of water and sediment in both fresh water and marine environment. Organic loading in the treated wastewater may reduce the dissolved oxygen content in the receiving water to the point that is not suitable for living organisms.

*(b) Objectives*

To prevent wastewater from project area runoff into natural water resources

*(c) Project Area*

Project and surrounding area

*(d) Description of Mitigation Measures*

The mitigation measures for water quality management are mainly consistent with wastewater and waste management system. However, specific consideration is proposed to further reduce the impact in the receiving water. The mitigation measures are discussed below:

- Prepare and implement the measures for Waste Management.
- Prepare and implement the measures for Wastewater Management.

- The discharged of untreated wastewater into the receiving water is strictly prohibited all time.
- Wastewater from the initial township operation shall be reused to water the trees planted in the initial township.
- Emergency plan for operation of wastewater treatment should be established to prevent untreated effluent discharged into the receiving water.

*(e) Description of Monitoring Program*

The monitoring program can be conducted from freshwater and sediment.

Surface water and sediment

- Surface water and sediment qualities monitoring should be established. A total of 6 sampling stations similar to those surveyed during baseline sampling is recommended. but in 9+1 phase ,only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored
- The parameter and sampling station of surface water and sediment quality monitoring are shown in
- and
- The surface water and sediment monitoring should be conducted at least 3 times a year (dry, early wet and end of wet season).

**Table 8.3-1 Analysis Methods of Surface Water and Sediment Quality Parameters and Sampling Stations During Operation Period**

Parameters	Analysis Method <sup>1/</sup>	Sampling Station
<b>Surface Water</b>		
Water Level/Depth/Width	Depth Meter	TS-SW1: Discharge point at the north of the project at KM 18+500
Temperature	Thermometer	
Flow Rate	Flow Meter	
pH	Electrometric Method	TS- SW2: Upstream at Yalai Chaung at meeting point of Yalai Chaung and canal (that receiving wastewater from discharge point at south of the project)
Salinity	Electrical conductivity Method	
Electrical Conductivity	Electrical Conductivity Method	TS-SW3: Downstream at Yalai Chaung at meeting point of Yalai Chaung and canal (that receiving wastewater from discharge point at south of the project)
DO	Membrane Electrode Method	
BOD	Membrane Electrode Method	
Turbidity	Nephelometric Method	TS- SW4: Dawei River at the boundary of the project area at Ta Nyin In village
TSS	Total Suspended Solids Dried At 103-105 °C	
TDS	Total Dissolved Solids Dried At 180 °C	TS-SW5: Dawei River (at about 500 meters upstream from the Yang Gaeng bridge)
TS	Total Solids Dried At 103-105°C	
Nitrate-Nitrogen	Cadmium Reduction Method	TS-SW6: Dawei River (at about 500 meters downstream from the Yang Gaeng bridge)
Ammonia-Nitrogen	Phenate Method	
Phosphate -Phosphorus	Ascorbic Acid Method	
TKN	Kjeldahl Method	
Oil&Grease	Soxhlet Extraction Method	
TCB	Multiple Tube Fermentation Technique	
FCB	Multiple Tube Fermentation Technique	
E.Coli	Multiple Tube Fermentation Technique	

Remark: <sup>1/</sup> APHA, AWWA and WEF. Standard Methods For The Examination of Water And Wastewater. 22<sup>nd</sup> ed. Washington, DC: APHA. 2012.

<sup>2/</sup> United States Environmental Protection Agency. SW-846 Method.

*(f) Work Plan (Duration)*

Throughout the operation phase

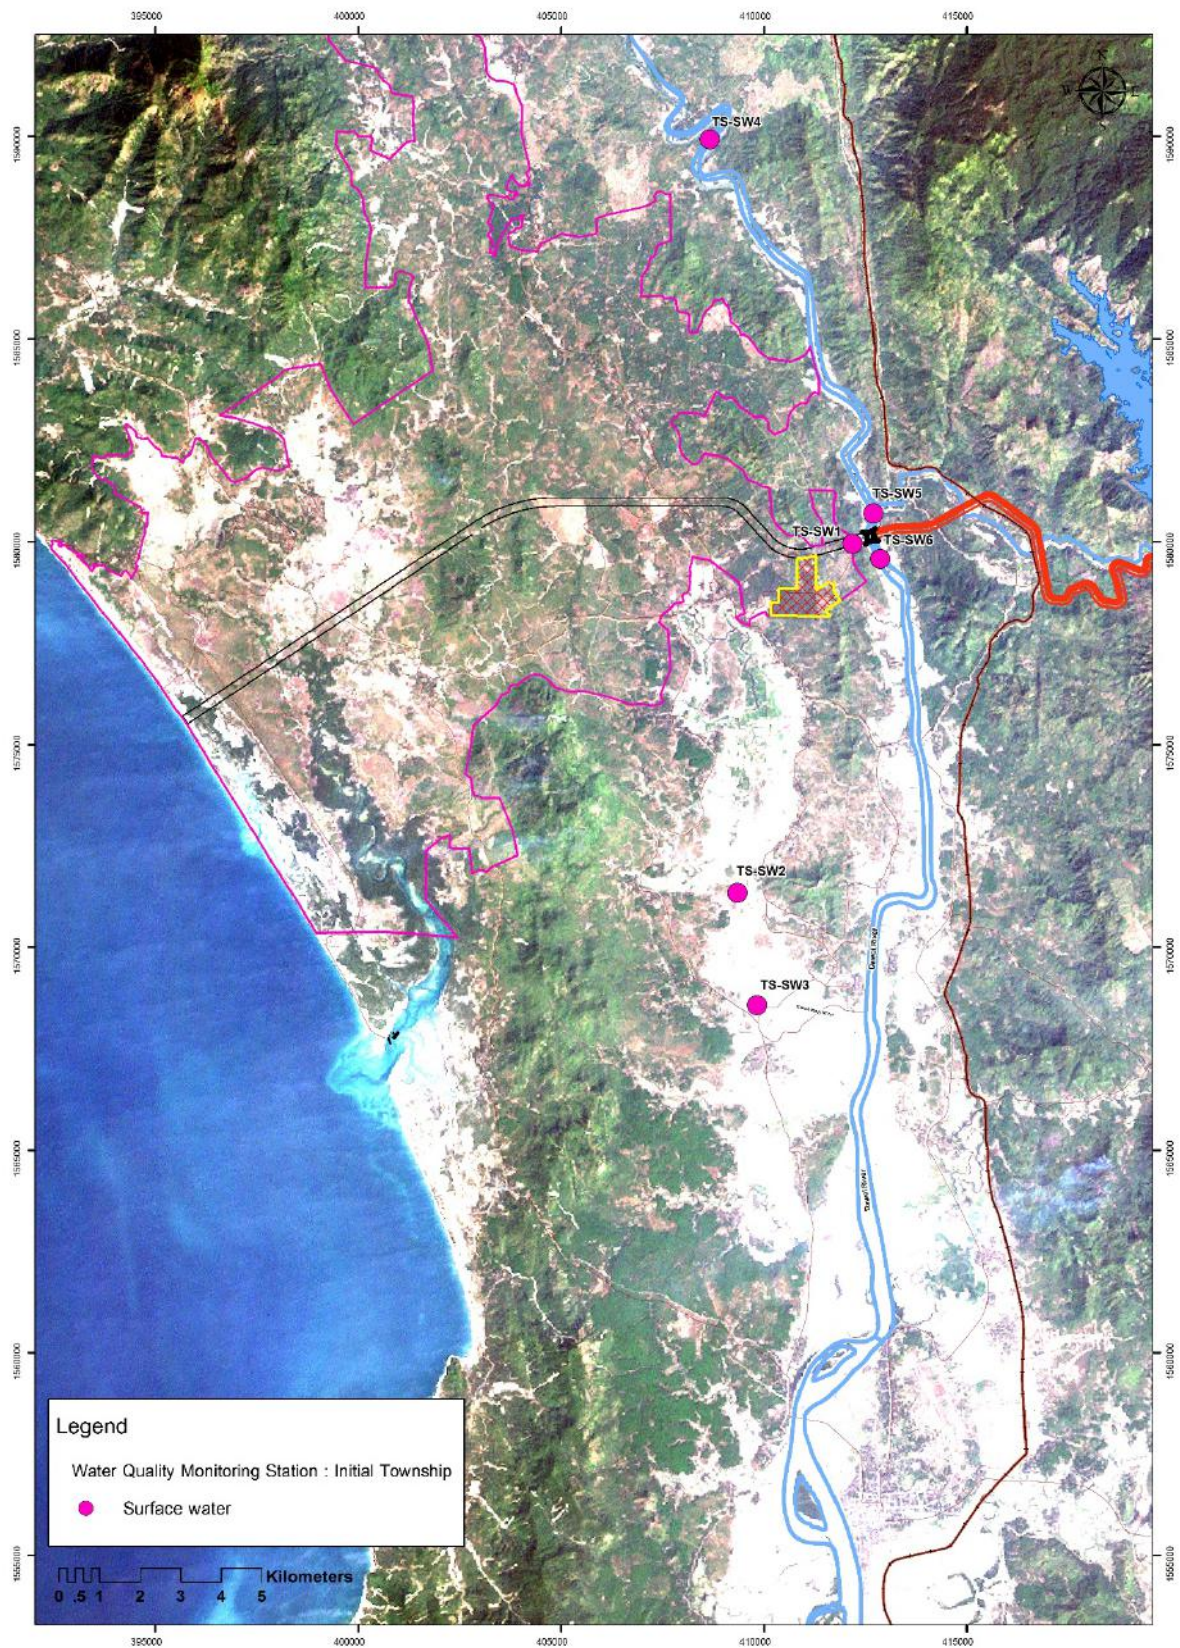

*(g) Responsible Organizations or Agency*

DRC shall maintain overall ambient environment monitoring program and results. The results need to be communicated with WC every 6 months.

*(h) Budget*

Approximately 40,000 USD/year

**Figure 8.3-1 Sampling Locations for Surface Water and Sediment Quality Monitoring in Operation Phase**

### 8.3.4 Terrestrial Ecology Action Plan

#### (a) Principle and Rational

Potential impacts to terrestrial ecology during operation phase are considered negligible. However, influx of workers from outside the area may result in increased demand of wildlife meat and poaching. Education and discouragement of consumption and domestication of wildlife need to be conducted all through the project life.

#### (b) Objectives

To prevent waste from project area runoff into natural resources. And reducing impact to wildlife habitats or plants

#### (c) Project Area

Surrounding area of the project

#### (d) Description of Mitigation Measures

The mitigation measures for terrestrial biology is proposed as follow:

- Wherever possible, conserve the existing trees, particularly in the green areas,
- Coordinate with local authorities and engage local communities for reforestation projects surrounding the project area.
- Discourage and educate the workers towards wildlife consumption to reduce demand and indirect impacts to the wildlife in reserved forests elsewhere outside the project area.

#### (e) Description of Monitoring Program

No monitoring program is required

#### (f) Work Plan (Duration)

Throughout the operation phase

#### (g) Responsible Organizations or Agency

DRC in corporation with the local authorities should promote the implementation of the above mitigation measures

#### (h) Budget

Included in operation monitoring budget.

### 8.3.5 Land Use, Township and Community Management Action Plan

#### (a) Principle and Rational

Change of land use surrounding the project area is of concern. Spontaneous development surrounding the township need to be planned and controlled.

#### (b) Objectives

To control the effect to landuse changing and community

#### (c) Project Area

In the project area only

#### (d) Description of Mitigation Measures

##### Special Plan and Buffer Zone

A special specific area plan is needed to control the land use adjacent to the project area. The plan must be legitimate and authorized by the state. The purpose of the plan is to control land use nearby but outside the township and to prevent forming of temporary settlement growing outside the township area at inappropriate places. Moreover, a clear and marked buffer zone all around the township boundary should be set up to control and prevent any uses other than agriculture and forest. The size of the buffer zone should be determined by land use expert to ensure that in case of fire or other hazards, only a minimum number of people will be affected and rescue and relocation efforts will be with ease.

In addition, the town of Dawei, the nearest town and most likely place to be used for services to the non-local personnel, will be greatly affected by the estate and township development. A comprehensive plan authorized by the state for the future of Dawei is needed for appropriate growth. Otherwise, the project development will likely cause uncontrollable growth of Dawei resulting in degrading physical, uses and cultural condition of Dawei city in the near future.

##### Setting up a management committee overseeing the project land use.

A team or committee should be set up to monitor and manage activities and structures built in and around the project area. The purpose is to insure that those temporary service centers originated from basic needs and convenience of the workers are always in the appropriate places that will not obstruct or endanger the operation of the township. The team should have legitimate authority to control the areas adjacent or nearby, though outside the township boundary. Squatters must be notified that they are only allowed to operate temporarily and must be relocated when the time comes in order to prevent scattered temporary structures from evolving into unsuitable permanent settlements outside the initial area.

### Transportation and Infrastructure Outside the Initial Area

For the area immediately outside the township, not only land use should be controlled, but also other infrastructure that will enable setting up structures and services, such as, local roads, electricity, water supply and drainage, should be also well planned and controlled. The strategic locating or prohibiting of these basic infrastructure will induce and encourage early settlers and services outside designated township zone into the area planned by the management to provide temporary services in the early stage of development.

### Enforcement

The proposed set-up land use management committee/team should have duty to regularly monitor land use activities outside and inside the township area as the development progresses. Co-operation with local or state authority is needed to be able to control, direct, or enforce private buildings outside the project boundaries to prevent unsuitable and obstructing growth nearby the project area.

#### *(e) Description of Monitoring Program*

The mitigation measures mentioned above a long-term and involve many parties in planning and implementing the land use surrounding the project to help ensure that on a longer term, communities will be located at a safe distance from the initial township and conflicts between both developments can be reduced

#### *(f) Work Plan (Duration)*

Throughout the operation phase

#### *(g) Responsible Organizations or Agency*

DRC through cooperation with local authorities.

#### *(h) Budget*

Included in operation monitoring budget.

### **8.3.6 Public and Occupational Health Action Plan**

#### *(a) Principle and Rational*

Operation phase of the project possess different risks to the workers and public. DDC as the owner of the project will need to have a program in place to handle the situations that may arise from the work-related illness and impacts in workers and local populations.

#### *(b) Objectives*

To reduce risk and prevent danger and accident which may happen to worker and people transport or live in the operational area of the project.

(c) *Project Area*

Project and surrounding area

(d) *Description of Mitigation Measures*

Occupational Health and Safety:

During operation phase, DRC or the project owner should establish the preventive and protective measures to mitigate the potential occupational health impacts as follows:

*Accidents and Injuries*

- Provide the environmental health and safety management system and programs for the whole initial township.
- Establish occupational health and safety management plans and programs to assess and manage EHS impacts and risks which are based on comprehensive job safety analyses.
- Include the following issues in the occupational health and safety management system:
  - Accident investigation, recording and reporting
  - Surveillance of the employee's health
  - Training and hazard communication
  - Monitoring and auditing procedures to evaluate the effectiveness of prevention and control measures
- Perform occupational accidents and disease recording and reporting, investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.
- Provide area signage and labeling of equipment in accordance with international standards and easily to understand by employees, visitors and general public.
- Promote traffic safety programs to all personnel, for example;
  - Improving driving skill
  - Use of speed control devices

*Occupational, Sexual Transmission and Communicable Diseases:*

- Conduct surveillance and active screening and treatment of employees. Immunization program may be required.

- Provide training programs for employees in these following topics: health awareness and promote health protection strategies including encouraging condom use.
- Perform periodic employee's health checks in accordance with the potential risks.

*Fire and Other Hazards:*

- Provide comprehensive emergency preparedness and response plan and procedures covering fire and other hazards control.
- Provide appropriate emergency services and personnel to execute emergency response when needed, and maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.
- Establish appropriate fire safety system to ensure its capability to cope with all the potential hazards.
- Conduct annual training and updating emergency preparedness and response plan to account for changes in equipment, personnel and facilities.

*Adequacy and Readiness of Healthcare Services*

- Establish the hospital in the township area, and periodically evaluate in terms of adequacy, capacity and readiness in accordance with the change in numbers of population in the township.

Community Health:

*Sanitation*

- Provide sufficient infrastructure amenities and public health services for the township, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment in order to reduce pressure on local authorities in servicing public.
- Technically support or collaborate with local authorities to enhance potentiality of communities in solid waste disposal by means of 3Rs (Reduce, Reuse and Recycle).

*Environmental/Communicable/Non-Communicable Diseases:*

- Establish the buffer strip/zone to separate the township and industrial estate to protect dwellers from pollutions emitted.

- Implement engineering preventive measures to install physical separation between industry and community, for example fence or tree plantation as buffer zone along the estate boundaries, and use of air modeling results and/or potential pollutions of each industry as the criteria for the distance between industries and affected community.
- Set up a grievance procedure to manage complaints, if any.

#### *Accidents/Fire*

- Invite representative of local emergency and securities services to participate in annual site inspections to ensure familiarity with the potential hazards present.
- Inform and communicate potential accidents that may impact to community to local communities and relevant parties.
- Prepare and train employees, people in township and nearby communities to respond to accidents, including providing technical and financial resources in order to control and response such events effectively and safely, and provide periodic emergency response practice with communities.
- Revised or/and establish Emergency Response Plans in accordance with recent policy, laws and regulations.

#### *Adequacy and Readiness of Healthcare Services*

- Promote collaboration with local authorities to enhance access of community to public health services for the employee's families and people being at residences in township to develop health service facility.
- Risk and impact to environment from operation of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.

#### *(e) Description of Monitoring Program*

DRC will keep monthly update of health and safety statistics and records. Performance of operation health and safety is monitored against a set benchmark. DRC to periodic inspect health and safety conditions of the industry.

#### *(f) Work Plan (Duration)*

Throughout the operation phase

#### *(g) Responsible Organizations or Agency*

DRC shall establish EHS Plan expanding necessary components as listed above. DDC will be responsible for keeping all health and safety records and assessing health and

safety performance of the township. DRC is the party coordinating with local authorities on behalf of the project in the matter related to health and safety of the township.

*(h) Budget*

Included in operation monitoring budget

### **1.3.7 Employment and Training Program**

*a) Principle and Rational*

Concerns from communities and the Project Affected People on skills necessary for employment including their job opportunities and employment condition during the operation phase in the township.

*b) Objectives*

To support locals for job opportunities and employment and skills training.

*c) Project Area / Stakeholders*

Project operation area and local communities and with project impacted people.

*d) Description of Mitigation Measures*

DRC shall conduct employment with IFC EHS General guideline/Laws and regulations in terms of the employee management and established plan for training programme and implement.

*e) Description of Monitoring Program*

Ensure that the standard of employment in accordance with relevant law and regulation are implemented. Employee has been trained as necessary.

*f) Work Plan (Duration)*

Every 5 years for the entire operation phase

*g) Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

*h) Budget*

Included in operation budget

### 1.3.8 Public Participation and Dissemination

#### a) *Principle and Rational*

Public participation and information dissemination is apart environmental assessment process and sustainable development that will be result in economic, environmental and social values. General public idea about the project such as concerns of stakeholders, information and recommendation from public can be gathered through public meetings and social surveys which this information will be considered and can take accounted by DRC for further project management plans.

#### b) *Objectives*

To inform the stakeholders about the Initial Township project, gain public views, concerns and values, increase public confidence, improve transparency and accountability in the EIA decision-making process.

#### c) *Project Area / Stakeholders*

Project operation area and impacted area with various level of government agencies, relevant and responsible agencies, project impacted people, media and dependent organizations.

#### d) *Description of Mitigation Measures*

DRC shall establish public relation and public participation plan to incorporate in requests and recommendation of the continuous engagement of stakeholders following

- Inform about project activities to community
- Support nearby community as appropriate to build good relationship with community
- Communicate to build community understanding about
  - Potential environmental impacts and mitigation measures
  - CSR activity
- Conduct by DRC consistent with the applicable standard for public meeting/consultation
- Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.
- Take account the results of the public consultation in improving and revised the EMPs.

#### e) *Description of Monitoring Program*

DRC will conduct public meeting or public relation e.g. using questionnaire or attitude survey for communities surrounded the Initial Township Project within 1 km in radius of the project areas every 5 years. The result must be report and the method must achieve

acceptable standard and been carried out with representative samples with confidence statistics.

f) *Work Plan (Duration)*

Every 5 years for the entire operation phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in operation budget

### 1.3.9 Grievances Redress

a) *Principle and Rational*

For transparency and performance of the project in dealing with grieves that raise by communities and affected people. Grievance mechanism shall be implemented.

b) *Objectives*

To received grieves and complains from affected people or organization and manage the grieves effectively.

c) *Project Area / Stakeholders*

Project operation area and impacted area with project impacted people or impacted organizations.

d) *Description of Mitigation Measures*

DRC shall establish Grievance Redress Committee and Grievance Redress procedure to address any complaints / grieves to resolve / settle disputes that brought forward by community pertaining to project activities.

e) *Description of Monitoring Program*

Ensure that the grievance redress mechanism has been implemented. Complaints/grieves are systematically recorded and cases are settled.

f) *Work Plan (Duration)*

Every 5 years for the entire operation phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsile for this matter

h) *Budget*

Included in operation budget

Summary of the Environmental Management Plan (EMP) are shown in to Table 8.3-2 and Table 8.3-3. It should be noted that the two EMPs prepared as part of this ESIA study are invariably framework plans as they are based on outline designs of the Project. They are therefore intended to prescribe requirements for the preparation of detailed CEMP and OEMP by the appointed EPC contractor (Contractor). Consequently, they could be considered and referred to as the Project Proponent's or Owner's EMPs to distinguish them from the Contractor's EMP after the ESIA during project implementation. Nevertheless, it should be noted that the planning and development of the Project has been dynamic throughout the study period. This includes also the organization of the project and other relevant agencies. The information used as the based scenario is considered the most valid one at the time of the report preparation. Changes to the project information may occur overtime and, therefore, readers and project implementers are advised to review at the time of the implementation.

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
Erosion and Sedimentation Control	<p>CC shall prepare an <i>Erosion and Sediment Control Plan</i> for construction activities and submit to DRC for approval prior to commencement of construction activities in the area. The plan shall have the following components:</p> <ol style="list-style-type: none"> <li>1. An assessment of the potential for contamination of natural waterways. Basic principles include the size of the disturbed area, site drainage, and waterways receiving storm water from the disturbed area;</li> <li>2. Plans for water management during construction shall be established and include adequate drainage system to manage runoff from 2-year ARI storm flow;</li> <li>3. Sedimentation controls shall be implemented in the form of silt trap fences and sedimentation basins where appropriate, and all runoff from the disturbed area shall be directed to the sediment controls;</li> <li>4. Measures to be taken to collect, store and treat storm water prior to discharge from the site considering options for water re-use onsite;</li> <li>5. Management of material storage area - Stockpile and spoil disposal area shall not be located on drainage line;</li> <li>6. Control of erosion and sedimentation shall be constructed progressively prior to commencement of each stage of earthworks until the permanent protection is established.</li> </ol>	CC with DRC's approval
Aquatic Biology	<ol style="list-style-type: none"> <li>1. Prepared and implement the measures for erosion and sedimentation control, waste management, and construction work camp</li> <li>2. Release of oil and grease from workshop facilities is prohibited. Used oil need to be stored separately and managed as per Waste Management Plan.</li> <li>3. Stock yards; gasoline, oil, lubricant and hydraulic oil storage areas; and machines/vehicles cleaning areas should be located at least 100 meter away from natural waterways.</li> </ol>	CC with approval and under DRC's supervision
Terrestrial Biology	<ol style="list-style-type: none"> <li>1. Only clear the area needed for construction of infrastructure and utility system. Avoid disturbance of forest and mangrove as much as possible.</li> <li>2. Wherever possible, identify the endangered species and transfer them to safe locations prior to clearing the vegetation.</li> <li>3. Hunting of wildlife is prohibited.</li> <li>4. Disturbance of forest areas outside the project area by CC and their subcontractors is prohibited.</li> </ol>	CC under DRC's supervision

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
Air Emission and Noise Control	<ol style="list-style-type: none"> <li>1. All equipment and vehicles will need to be maintained in good mechanical conditions;</li> <li>2. Stationary noise sources (such as generators, concrete batching plants etc.) shall be sited as far as possible from villages, construction camps and resettlement areas;</li> <li>3. Construction works within the distance of 500 m from villages and resettlement areas will be carried out between 06:00 to 18:00;</li> <li>4. Dump trucks with loads that may generate dust will be covered when travelling through communities;</li> <li>5. Water spraying at least once a day in the construction areas and on unpaved roads is required in the following conditions:                             <ol style="list-style-type: none"> <li>5.1 On the section of unpaved transportation routes that pass through communities or construction work camps;</li> <li>5.2 When dust generating activities are being carried out within 100 m of a village or construction work camp;</li> <li>5.3 When visual inspection indicates excessive dust generation in the construction areas and unpaved roads used for material transportation.</li> </ol> </li> <li>6. Burning of waste materials including waste vegetation from site clearing will be allowed under the following conditions:                             <ol style="list-style-type: none"> <li>6.1 The materials that are allowed to be burned are general garbage and vegetation waste. No burning of materials that may generate toxic gases is allowed;</li> <li>6.2 A trained fire protection officer with appropriate firefighting equipment's has to be present near the burning areas;</li> <li>6.3 Burning is not allowed during severe wind conditions;</li> <li>6.4 Burning is carried out at a safe distance from vegetated areas and not within 2 km from a village, a construction work camp, or resettlement areas on the upwind direction.</li> </ol> </li> <li>7. Avoid impact pile-driving where possible in vibration-sensitive areas. Drilled piles or the use of a sonic or vibratory pile driver causes lower vibration levels where the geological conditions permit their use.</li> <li>8. Construction workers exposed to noise levels of 80 dB(A) or more shall be provided with adequate Personal Protective Equipment (PPE).</li> </ol>	CC under DRC's supervision
Waste Management	DRC shall develop <i>Waste Management Plan</i> that will be applicable to all contractors in the project. The Waste Management Plan shall include the following components:	DRC to develop <i>Waste Management Plan</i> ;

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	<ol style="list-style-type: none"> <li>1. Identify classification of waste. The minimum waste classification shall be non-hazardous and hazardous waste;</li> <li>2. Identify the size and location of the temporary hazardous waste storage area and non-hazardous waste disposal site for the construction phase of the industrial estate;</li> <li>3. A mechanism for coordination between DRC and CC in waste separation, waste transfer, record of waste quantity.</li> <li>4. Hazardous waste shall include, but not limited to, the following waste materials. Any mixed waste stream that contains any of the hazardous waste shall be categorized as hazardous waste:                         <ol style="list-style-type: none"> <li>4.1 Acids and acid waste;</li> <li>4.2 Alkalis and caustic waste;</li> <li>4.3 Batteries;</li> <li>4.4 Spent catalysts, solvents, and chemicals;</li> <li>4.5 Empty containers which held chemicals, paint, oil and solvents;</li> <li>4.6 Oil contaminated waste including oily rags, oil filters, used gloves;</li> <li>4.7 Used oil, hydraulic fluids, chemicals and solvents;</li> <li>4.8 First aid and medical waste;</li> <li>4.9 Spill clean-up waste;</li> <li>4.10 Waste from grease trap; and</li> <li>4.11 Sludge from chemical wastewater treatment system.</li> </ol> </li> <li>5. Hazardous waste shall be stored in appropriate temporary hazardous waste storage areas until the permanent hazardous waste management facilities for the operation phase is functional. Minimum requirements of the temporary hazardous waste storage areas include:                         <ol style="list-style-type: none"> <li>5.1 Impervious floor without cracks or spaces that may allow spills to perforate into the ground;</li> <li>5.2 Surrounded by secondary containment bunds. The secondary containment bunds shall be at least 0.5 m high with a volume large enough to contain the spill of the largest container expected in the storage area;</li> <li>5.3 Designate storage area for liquids or materials that are not allowed to be mixed, such as acids and alkalis;</li> <li>5.4 Equipped with spill response kits;</li> </ol> </li> </ol>	<p>CC to implement the plan under DRC's supervision</p>

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	<p>5.5 Consider providing the area with roofing and temporary walls with a provision that the temporary hazardous waste storage area will have to be in use for at least 3 years until the permanent hazardous waste management facilities of the initial township are functional.</p> <p>5.6 Type and quantity of hazardous waste in the storage area shall be recorded and kept up to date.</p> <p>6. Burning of the following non-hazardous waste is allowed: cardboard, pallets, papers, and wood/vegetation waste. The waste burning site shall be designated in the Waste Management Plan and shall be at least 2 km from any villages, construction work camps, or resettlement areas.</p> <p>7. Other non-hazardous waste shall be transferred to non-hazardous waste disposal site to be used during construction phase shall meet the following minimum requirements:</p> <p>7.1 The disposal site shall be on higher ground not subject to flood.</p> <p>7.2 The disposal site shall be at least 2 km from any groundwater well that is being used by workers or local villagers.</p> <p>7.3 The disposal site shall be in the area where no excavation is planned. It shall be delineated with clear sign boards.</p> <p>7.4 The waste shall be covered with soil on daily basis.</p> <p>7.5 The location of all disposal sites during construction period shall be recorded as expanded appendices to the Waste Management Plan.</p> <p>8. Establish a training program for workers related to waste classification, storage and disposal.</p> <p>9. The Waste Management Plan may be expanded to cover recyclable waste and compostable waste in the future.</p>	
On-Site Traffic and Access Management	<p>1. All access roads in the construction area shall be signposted with the following information in Myanmar and English:</p> <p>1.1 Speed limit;</p> <p>1.2 Construction activities and machinery;</p> <p>1.3 Roadside borrow pits and material stockpiles;</p> <p>1.4 Any applicable load limit, particularly for temporary bridges; and</p> <p>1.5 Road features that may affect driving conditions such as curves, hidden accesses etc.</p>	CC under DRC-s supervision

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	<ol style="list-style-type: none"> <li>2. A speed limit of 40 km/hr. shall be applied in village areas and construction camps. Drivers shall be trained and notified of such limit;</li> <li>3. Consider building speed humps before and after each village, where appropriate;</li> <li>4. Route for heavy vehicles used for transportation of construction materials shall be designated. Route with least number of villages and residential area is most preferable;</li> <li>5. Survey of the access roads to identify blind spots need to be regularly conducted. Improvement to the blind spots such as removal of obstructing objects when necessary; and</li> <li>6. Access road used for the construction activities shall be maintained in good conditions.</li> </ol>	
Construction Work Camps	<ol style="list-style-type: none"> <li>1. Camp rules shall be established and informed to all residences. The rules should contain the following components:                             <ol style="list-style-type: none"> <li>1.1 Policy on alcohol and substance abuse;</li> <li>1.2 Safety measures and emergency response particularly in case of fire;</li> <li>1.3 Waste management requirements;</li> <li>1.4 Other measures to prevent dissemination of vectors and transmissible disease including STDs and HIV/AIDs;</li> </ol> </li> <li>2. General areas of the camp shall be kept clean and tidy. Waste shall be collected regularly to avoid accumulation of waste in the camp;</li> <li>3. Toilets shall be provided at a ratio as 1 toilet per 15 workers. All toilets shall be equipped with septic and seepage tanks of adequate size. The toilets need to be at least 100 meters from any natural waterways. Sludge from tank cleaning shall be stabilized by adding lime (pH = 12 for 30 minutes) and disposed of in designated pit for sludge disposal. The pit shall be at least 1 kilometer from any groundwater wells and is higher than groundwater table;</li> <li>4. Proper drainage has to be provided. Improve areas with stagnant water as much as possible; and</li> <li>5. Pest control measures shall be planned and implemented. All bedrooms need to be equipped with mosquito protection.</li> </ol>	CC under DRC's supervision
Historical and Cultural Resources	<ol style="list-style-type: none"> <li>1. Sites with historical and cultural values shall be identified, recorded and located in the map. This information shall be agreed upon by the local authorities and villagers.</li> <li>2. If construction activities have to be carried out within 50 meters from these sites, the leaders of the communities that the sites belong to need to be notified at least 1 week prior to commencement of the activities.</li> </ol>	CC under DRC's supervision

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	3. Establish a plan and communication channel in case an unidentified site is encountered during the construction work to avoid damage to the site.  4. Removal and relocation method and destination shall be a mutual agreement between DRC, local authorities, and the leader of the communities that the site belongs to.	
Risk Assessment	1. Require the ITD contractor to: <ul style="list-style-type: none"> <li>- Prepare a Construction Phase Environmental Management Plan (CEMP) base on the EIA report and associated CEMP, detailed design and construction plan and schedule. The CEMP must clear define.</li> <li>- The project's environmental requirements and obligation.</li> <li>- Physical measures that are needed to comply with the requirements and obligation.</li> <li>- Construction measures that are needed to comply with the requirements and obligation.</li> <li>- Assignment of responsibilities to each subcontractors.</li> </ul> 2. TOR for procurement of the ITD contract must clearly state the project's environmental requirements during the construction phase that the ITD contractor must ensure that the project construction will meet the requirements.  3. The ITD contract must clearly prescribes environmental management responsibility of the ITD contractor.  4. The supervision consultant will be required to submit a supervision and monitoring plan that clearly indicates the environmental tasks to be supervised and monitored. This supervision and monitoring plan for the implementation of the environmental mitigation measures.  5. Monthly reviews of the ITD contractor environmental performance.  6. Close supervision of truck operations especially during the site filling period.  7. Changes in designs or construction methods may be initiated by the ITD contractor or the project proponent. The request for changes must be subject to the change procedure in project management. The request for changes must be accommodated by an analysis of environmental implications and revised mitigation measures.  8. Change in the environmental requirements may be initiated by DRC or the project proponent with approval of DRC. The change must be subject to the change procedure in project management. The ITD contractor will analyze environmental implications of the changes and revise the originally proposed mitigation measures accordingly.	CC under DRC-s supervision

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
Public and Occupational Health	<ol style="list-style-type: none"> <li>1. Accidents and Injuries                             <ol style="list-style-type: none"> <li>1.1 Establish occupational and safety management plan and program for the construction should be established to assess and manage EHS impacts and risks. Project or activity-specific plans or procedures should be prepared and the basic site rules of work should be included.</li> <li>1.2 Perform occupational accidents and disease recording and reporting, and investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.</li> <li>1.3 Provide contractor management plan to ensure that the contractor will have safety performances and procedures to protect their employee. Supervise and monitor contractor performance periodically.</li> <li>1.4 Train and provide information to employees. Occupational health training program should be provided as needed, for example, hazard awareness, specific hazards and safe work practices, to ensure that workers are capable of work safely.</li> <li>1.5 Provide appropriate personal protective devices to employee and ensuring that personal protective devices will be worn during working at all time.</li> <li>1.6 Restrict local community to access the site or area using fencing, signage and risks communication.</li> <li>1.7 Appropriately mark area signage and labeling of equipment, determine hazardous area, for example electrical rooms, compressor etc., as well as installations, materials and emergency exits, and label in accordance with international standards, and easily to understand by workers, visitors and general public.</li> </ol> </li> <li>2. Occupational, Sexual Transmission and Communicable Diseases                             <ol style="list-style-type: none"> <li>2.1 Supervise and monitor performance of contractors and sub-contractors on housekeeping in the camp site.</li> <li>2.2 Include training programs for workers with these following topics: health awareness, hygiene and sanitary, waste management, communicable and transmission diseases, cultural awareness, regulations and compliance, and drug abuse.</li> <li>2.3 Register foreign or migrated workers should be seriously performed to ensure that these workers have medical and health certificates to guarantee their personal health conditions.</li> <li>2.4 Conduct surveillance and active screening and treatment of workers. Immunization program may be required.</li> </ol> </li> </ol>	CC under DRC-s supervision

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	3. Emergency Response and First-Aid  3.1 Establish emergency response plan and procedures which also should be in place for any remote sites.  3.2 Provide appropriate emergency services and personnel to expedite emergency response when needed, maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.  3.3 Provide health services and first-aid unit at all time, with comprehensive and appropriate equipments, establish the qualified the first-aid unit to properly handle with serious or trauma cases, and sufficient to meet the requirements, treat and/or patients to appropriate medical facilities in time.	
Community Health	1. Housing and Sanitation  1.1 Provide sufficient infrastructure amenities and public health services in the camp site, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment.  2. Environmental/Communicable Diseases  2.1 In close collaboration with the community health authorities, implement an integrated control strategy for environmental and occupational diseases, such as integrated vector control programs, eliminating of breeding habitats in the camp site, and eradicating disease reservoirs.  2.2 Collaborate with community health authorities to enhance the worker families to access public health services, and promote immunization.  2.3 Distribute appropriate education materials for example health awareness, sexual transmission disease and communicable disease.  3. Accidents/Fire/Chemical Leaks  3.1 Consider the level of local firefighting capacity to identify firefighting equipment that should be available when needed, and provide all necessary equipment with regular maintenance program.  3.2 Communicate potential accidents and/or hazards to local authorities, communities and relevant parties.  3.3 Conduct emergency response practices, including liaison with local response organizations and local responders.  3.4 Revise or/and establish Emergency Response Plans that in concurrent with relevant policy, law and regulation.	

**Table 8.3-2 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Construction Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	4. Adequacy and Readiness of Healthcare Services 4.1 Provide the first aid unit at the camp site for their workers, assess whether the local health service capacity sufficient for worker's family and supporting industries, and in close collaborating with local authorities, consider supporting additional health service facility. 4.2 Risk and impact to environment from construction of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.	
Public Participation and Dissemination	<ul style="list-style-type: none"> <li>• Establish <i>Public Relation and Public Participation Plan</i> to incorporate in requests and recommendation of the continuous engagement of stakeholders following:                             <ol style="list-style-type: none"> <li>1. Inform about project activities to community</li> <li>2. Support nearby community as appropriate to build good relationship with community</li> <li>3. Communicate to build community understanding about                                     <ul style="list-style-type: none"> <li>- Construction activities and progress</li> <li>- Potential environmental impacts and mitigation measures</li> </ul> </li> <li>4. Conduct by DRC consistent with the applicable standard for public meeting/consultation</li> <li>5. Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.</li> </ol> </li> <li>• Take account the results of the public consultation in improving and revised the EMPs</li> </ul>	DRC
Grievances Redress	Establish <i>Grievance Redress Procedure</i> to address any complaints/grievances to resolve/settle disputes that brought forward by community pertaining to project activities.	DRC

MC: Management Committee  
 DRC: Dawei Residence Company Limited  
 CC: Construction Contractors

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
Environmental Policy, Rules, and	<p>DRC as the project owner has to establish the <i>Environmental Policy and Rules</i> for Initial Township based on the following principles:</p> <ol style="list-style-type: none"> <li>1. Eco city concept which have the following key components:                             <ol style="list-style-type: none"> <li>1.1 Integration with natural system.</li> <li>1.2 Maximize energy efficiency through facility design and other means.</li> <li>1.3 Material flow through the whole area and ensure maximum reuse and recycling.</li> <li>1.4 Water conservation, reuse, and recycling in the Initial Township.</li> </ol> </li> <li>2. Prepare <i>Environmental, Health and Safety Plan</i>. EHS management plan or programs should also be reassessed periodically to ensure that the key environmental health and safety risks are determined in accordance with changes in order that the potential risks will be appropriately addressed. Thus, EHS system and performance should be improved continuously by a combination of ongoing monitoring of the Initial Township and high performances as well as effective accountability of the facility</li> <li>3. Establish <i>Environmental Rules</i> that the township has to follow. These rules will be in accordance with the EMP for operation period. The rules will be attached with the contractual document between the contractor, operator and DRC.</li> </ol>	DRC
Overall Roles and Responsibilities of Project Owner	<p>DRC has to establish a strong organization to handle the dynamic and changes that will occur during the operation phase of the project, and should consider the following measures.</p> <ol style="list-style-type: none"> <li>1. DRC should establish a sector responsible for safety health and environmental management of the Initial Township to prepare and perform the environmental management plan and programs to ensure that the Initial Township comply with environmental legislation and other relevant safety health and environmental requirements, and to achieve the most up-to-date environmental protection requirements/measures/standards.</li> <li>2. DRC should periodically assess/reassess the environmental management plan or programs to ensure that the key environmental health and safety risks are evaluate.</li> <li>3. Due to the long period of the Initial Township project, DRC should ensure that EHS performance will be improved continuously via a combination of ongoing monitoring program and cooperation with the residences and community mall inside the Initial Township.</li> <li>4. DRC needs to prepare and commission a database system to keep track of and analyze environmental data, flow of materials and waste, water consumption, wastewater generation rate and quality, and energy consumption. The data base will help organize the data from monitoring program of DRC and of the township, and can also be used as a tool to promote conservation of material, energy, and water among the industries, if the database is designed properly.</li> </ol>	DRC

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	5. DRC should provide provisions to ensure that the project can apply proper environmental health and safety management to protect health and safety of workers and the public.	
Air Emission and Noise Control	1. Provide some space areas for tree planting within the project area. 2. Care and maintain the trees planted; in case the trees are dead, shall plant trees to replace the dead ones. 3. Install sign to notice that “Do not start the car while parking for waiting” at the parking area and reiterate the security guards to control strictly. 4. Limit vehicle speed inside township area as 30 km/hr. to mitigate possible noise impacts on nearby area. 5. Install the “No Audible” sign within residential and township areas in obvious places. 6. Plan for emission of GHGs from the Project shall be established and/or revised in concurrently with the relevant policy and regulations.	DRC or MC’s Authorized Agency
Waste Management	1. Design and construction of the landfill shall be in accordance with Solid Waste Disposal Facility Criteria – Technical Manual published by U.S. EPA (1993) or other applicable standards. 2. Detailed hydrogeological condition of the proposed landfill area has to be studied in the design of landfill. 3. Groundwater monitoring wells will be installed. As a minimum, 1 well is to be installed up-gradient of the landfill and at least 3 wells is to be installed down-gradient of the landfill. Depth of screens and well construction depends on the results from the hydrogeological condition study. 4. The components of the waste management facility: i.e. sanitary landfill, secured landfill and incinerator shall be designed and constructed according to the internationally accepted standards. 5. The facility shall create its Standard Operating Procedure covering steps from receiving waste, laboratory analysis, stabilization, temporary storage, incineration and disposal. Audit by third party is necessary. 6. The landfill shall be closed daily to prevent vectors and odors. 7. Classify hazardous and non-hazardous waste according to the definitions in the Waste Management Plan prepared.	DRC or MC’s Authorized Agency

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	8. Workers need to be trained of Waste Management Plan. 9. All hazardous and non-hazardous waste generated shall be transferred to the facility for disposal. 10. Waste manifest system has to be created and implemented. 11. Record of type of waste including its quantity shall be kept in the database of DRC.	
Water and Sediment Quality and Monitoring Program	1. Prepare and implement the measures for Waste Management and Wastewater Management. 2. The discharged of untreated wastewater into the receiving water is strictly prohibited at all time. 3. Wastewater from the initial township operation shall be reused to water the trees planted in the initial township. 4. Emergency plan for operation of wastewater treatment should be established to prevent untreated effluent discharged into the receiving water.	DRC or MC's Authorized Agency
Terrestrial Ecology	1. Wherever possible, conserve the existing trees, particularly in the green areas, 2. Coordinate with local authorities and engage local communities for reforestation projects surrounding the project area. 3. Discourage and educate the workers in the industrial estate against wildlife consumption to reduce demand and indirect impacts to the wildlife in reserved forests elsewhere outside the project area.	DRC or MC's Authorized Agency
Land Use, Township, and Community Management	1. Special Plan and Buffer Zone: 1.1 A special specific area plan, legitimate and authorized by the state, is needed to control the land use adjacent to the project estate. 1.2 A clear and marked buffer zone all around the township boundary should be set up to control and prevent any uses other than agriculture and forest. 1.3 The size of the buffer zone should be determined by land use expert to ensure that in case of fire or other hazards, only a minimum number of people will be affected and rescue and relocation efforts will be with ease. 1.4 A comprehensive plan authorized by the state for the future of Dawei is needed for appropriate growth. 2. A Management Committee Overseeing The Project Land Use:	DDC or MC's Authorized Agency

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	<p>2.1 A team or committee should be set up to monitor and manage activities and structures built in and around the project area.</p> <p>2.2 The team should have legitimate authority to control the areas adjacent or nearby, though outside the township boundary.</p> <p>2.3 Squatters must be notified that they are only allowed to operate temporarily and must be relocated when the time comes in order to prevent scattered temporary structures from evolving into unsuitable permanent settlements outside the initial area.</p> <p>3. Transportation and Infrastructure outside the Estate Area:</p> <p>3.1 For the area immediately outside the township and other infrastructures that will enable setting up structures and services, such as, local roads, electricity, water supply, and drainage, should be also well planned and controlled.</p> <p>3.2 The strategic locating or prohibiting of these basic infrastructures will be needed to induce and encourage early settlers and services outside designated township zone into the planned area.</p> <p>4. Enforcement:</p> <p>4.1 The proposed set-up land use management committee/team should have duty to regularly monitor land use activities outside and inside the township area as the development progresses.</p> <p>4.2 Co-operation with local or state authority is needed to be able to control, direct, or enforce private buildings outside the project boundaries to prevent unsuitable and obstructing growth nearby the project area.</p>	
Occupational Health and Safety	<p>1. Accidents and Injuries</p> <p>1.1 Provide the environmental health and safety management system and programs for the whole initial township.</p> <p>1.2 Establish occupational health and safety management plans and programs to assess and manage EHS impacts and risks which are based on comprehensive job safety analyses.</p> <p>1.3 Include the following issues in the occupational health and safety management system:</p> <ul style="list-style-type: none"> <li>• Accident investigation, recording and reporting</li> <li>• Surveillance of the employee's health</li> <li>• Training and hazard communication</li> </ul>	DRC or MC's Authorized Agency

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	<ul style="list-style-type: none"> <li>• Monitoring and auditing procedures to evaluate the effectiveness of prevention and control measures.</li> </ul> <p>1.4 Perform occupational accidents and disease recording and reporting, investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.</p> <p>1.5 Provide area signage and labeling of equipment in accordance with international standards and easily to understand by employees, visitors and general public.</p> <p>1.6 Promote traffic safety programs to all personnel, for example;</p> <ul style="list-style-type: none"> <li>• Improving driving skill</li> <li>• Use of speed control devices</li> </ul> <p>2. Occupational, Sexual Transmission and Communicable Diseases</p> <p>2.1 Conduct surveillance and active screening and treatment of employees. Immunization program may be required.</p> <p>2.2 Provide training programs for employees in these following topics: health awareness, and promote health protection strategies including encouraging condom use.</p> <p>2.3 Perform periodic employee's health checks in accordance with the potential risks.</p> <p>3. Fire and Other Hazards</p> <p>3.1 Provide comprehensive emergency preparedness and response plan and procedures covering fire and other hazards control.</p> <p>3.2 Provide appropriate emergency services and personnel to execute emergency response when needed, and maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.</p> <p>3.3 Establish fire safety system to ensure its capability to cope with all the potential hazards.</p> <p>3.4 Conduct annual training and updating emergency preparedness and response plan to account for changes in equipment, personnel and facilities.</p> <p>4. Adequacy and Readiness of Healthcare Services</p> <p>4.1 Establish the hospital in the township area, and periodically evaluate in terms of adequacy, capacity and readiness in accordance with the change in numbers of population in the township.</p>	

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
Community Health	<ol style="list-style-type: none"> <li>1. Sanitation                             <ol style="list-style-type: none"> <li>1.1 Provide sufficient infrastructure amenities and public health services for the township, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment in order to reduce pressure on local authorities in servicing public.</li> <li>1.2 Technically support or collaborate with local authorities to enhance potentiality of communities in solid waste disposal by means of 3 R (Reduce, Reuse and Recycle).</li> </ol> </li> <li>2. Environmental/Communicable/Non-Communicable Diseases                             <ol style="list-style-type: none"> <li>2.1 Establish the buffer strip/zone to separate the township and industrial estate to protect dwellers from pollutions emitted.</li> <li>2.2 Implement engineering preventive measures to install physical separation between industry and community, for example fence or tree plantation as buffer zone along the estate boundaries, and use of air modeling results and/or potential pollutions of each industry as the criteria for the distance between industries and affected community.</li> <li>2.3 Set up a grievance procedure to manage complaints, if any.</li> </ol> </li> <li>3. Accidents/Fire                             <ol style="list-style-type: none"> <li>3.1 Invite representative of local emergency and securities services to participate in annual site inspections to ensure familiarity with the potential hazards present.</li> <li>3.2 Inform and communicate potential accidents that may impact to community to local communities and relevant parties.</li> <li>3.3 Prepare and train employees, people in township and nearby communities to respond to accidents, including providing technical and financial resources in order to control and response such events effectively and safely, and provide periodic emergency response practice with communities.</li> <li>3.4 Revised or/and establish Emergency Response Plans in concordance with recent policy, law and regulation</li> </ol> </li> <li>4. Adequacy and Readiness of Healthcare Services                             <ol style="list-style-type: none"> <li>4.1 Promote collaboration with local authorities to enhance access of community to public health services for the employee's families and people being at residences in township to develop health service facility.</li> </ol> </li> </ol>	DRC in collaboration with local authorities

**Table 8.3-3 Environmental Management Plan (EMP) – Proposed Mitigation Measures for Operation Phase (Cont.)**

Potential Environmental Impacts	Proposed Mitigation Measures	Institutional Responsibilities
	4.2 Risk and impact to environment from operation of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.	
Employment and Training Program	Comply with IFC EHS General guideline/Laws and regulations in terms of the employee management and established plan for training programme and implement.	DRC
Public Participation and Dissemination	<ul style="list-style-type: none"> <li>• Establish <i>Public Relation and Public Participation Plan</i> to incorporate in requests and recommendation of the continuous engagement of stakeholders following:               <ol style="list-style-type: none"> <li>1. Inform about project activities to community</li> <li>2. Support nearby community as appropriate to build good relationship with community</li> <li>3. Communicate to build community understanding about                   <ul style="list-style-type: none"> <li>- Potential environmental impacts and mitigation measures</li> <li>- CSR activity</li> </ul> </li> <li>4. Conduct by DRC consistent with the applicable standard for public meeting/consultation</li> <li>5. Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.</li> </ol> </li> <li>• Take account the results of the public consultation in improving and revised EMPs</li> </ul>	DRC
Grievance Redress	Establish <i>Grievance Redress Procedure</i> to address any complaints/grievances to resolve/settle disputes that brought forward by community pertaining to project activities.	DRC
Revised and Report	<ul style="list-style-type: none"> <li>• Revised EMP and Emergency Response Plan depending on the changing in condition such fire hazard, safety from chemicals, flooding and earthquake and submitted to DSEZMC and MONREC</li> <li>• Reporting on performance of basic infrastructure e.g. local roads, electricity, water supply, safety and results of continuous public consultation in the monitoring reports that will carry out every 6 months and submitted to DSEZMC and MONREC</li> </ul>	DRC

## **8.4 Budget for Environmental Management and Monitoring**

This section describes the budget plans for the environmental management and environmental monitoring by the Project Proponent. Most of the environmental management cost and mitigation measures such as construction of retention ponds, polishing ponds, are already included in the project cost.

In terms of the budget for environmental monitoring before/during construction and operation phases, main monitoring cost is a cost for field measurements such as air quality, water, and quality noise. Annual costs for field measurements in the construction phase by contractor and in the operation phase by the Project Proponent are estimated in Table 8.4-1 and Table 8.4-2.

**Table 8.4-1 Environmental Management Plan (EMP) – Proposed Monitoring Measures for Construction Phase**

	Positions	Number	Estimated Budgets/Year (USD)		
<b>Staff</b>	1. Environmental Health and Safety (EHS) Manager	1	55,200		
	2. Environmental Supervisor	1	30,000		
	- Staff	3	64,800		
	3. Health and Safety Supervisor	1	37,200		
	- Staff	2	43,200		
<b>Total Staff Estimated Budgets/Year</b>			230,400		
Attribute	Inspection Issues and Monitoring Parameters	Location	Frequency	Responsibilities	Estimated Budgets (USD)
Erosion and Sedimentation Control	<u>Issues:</u> 1. Erosion and sediment controls are in place prior to wet season; 2. The drainage system and sediment controls are functional during wet season; 3. The sediment basins have a capacity of reducing the suspended solid from storm water by fifty percent (50%)	Construction area	Every 6 months	DRC or Third party consultant	
	<u>Parameter:</u> Total Suspended Solid	upstream and downstream of the entry points of surface water runoff from each construction area	As indicated in the Erosion and Sediment Control Plan	DRC or Third party consultant	50 ,construction area
Surface Water and Sediment Quality	<u>Parameters:</u> All parameters and analysis methods of as indicated in	Full Phase ,6 Sampling stations as shown in and 9+1 Phase ,2 Sampling stations (TS-SW02 and 03)	Every 6 months before and after rainy season, through the construction period or at least for 3 years	DRC or Third party consultant	36,000/year 12,000/year
Terrestrial Biology	<u>Issues:</u> Progress of construction work and vegetation clearing	Construction area,natural forests and mangrove areas	Every 6 months	DRC or Third party consultant

## 8.5 IMPLEMENTATION SCHEDULE

The implementation schedule as of May 2017 of the pre-construction, construction, and operation phases of the Initial Township project is as follows:

- 1) Pre-construction period :from 2017 to get approval of ESIA and land lease agreement
- 2) Construction period: 24 months after get approval of ESIA and land lease agreement, depend on demand basis of residence.
- 3) Operation period: 75 years (Maximum)

## 8.6 INSTITUTIONAL ARRANGEMENT

The organization structure for the operation and management of environmental monitoring is shown in **Figure 8.6-1**.

Source: EIA Study Team

**Figure 8.6-1 Organization structure for EMP and EMoP of the Project during operation phase**

### 8.6.1 Governing Bodies

According to the Myanmar Special Economic Zone Law (2011), there are 3 levels of government agencies directly associated with DRC

- Central Body

- Central Working Body
- Management Committee

The Central Body (CB) consists of members from ministries and government departments as assigned by the Government of Myanmar. CB is a policy making level among the three organizations. The duties of CB include reviewing proposals for development of a Special Economic Zone, determining type business, and other financial and taxes related matter. It reports to the Government of Myanmar. The Central Body is responsible to forming and assigning detailed duties to the Central Working Body (CWB) and Management Committee (MC).

CWB assists CB in reviewing the Special Economic Zone plan, determining of appropriate category of investment, and advising CB on matters regarding administration, management and legal issues in the Special Economic Zone. CWB reports to CB.

MC is the implementation mechanism of the governing bodies. One of the key duties of MC is supervising and inspecting the matters on implementation of investment plans and other matters including land use, environmental conservation, waste control, health, education, finance and taxation, transport, communication, security, electricity, energy and water supply etc. MC reports to both CB and CWB.

### 8.6.2 Project Proponent

The Project Proponent will be in charge of the overall operation of the initial township during the construction and operation. The Project Proponent will implement, EMP and EMoP as stated in this EIA report and almost by through construction contractors and sub-contractors.

Main tasks for environmental and social consideration in the Project are managed by Environment, Safety and Health section and / or Community relation division in Table 8.6-1.

**Table 8.6-1 Main Tasks for Environmental and Social Consideration in the Initial Township**

Division/Section	Main Tasks
Environment, Safety and Health section	<ol style="list-style-type: none"> <li>1) Monitoring the DSEZ Initial Industrial Estate area operations according to EMP and EMoP</li> <li>2) Submitting environmental monitoring reports to DSEZMC</li> </ol>
Community relation division	<ol style="list-style-type: none"> <li>1) Grievance Adjustment                             <ul style="list-style-type: none"> <li>- Handling complains/ claims/ requests from community and its response as necessary</li> <li>- Coordinating between tenant and community for grievance adjustment</li> </ul> </li> <li>2) Planning and implementation of CSR activities</li> </ol>

Source: EIA Study Team

### **8.6.3 Construction Contractor and sub-contractors**

Construction Contractors (CC) refer to the contractors for the development of Initial Township, which include constructions of utility systems (i.e. water treatment and distribution system, wastewater collection and treatment system, irrigation system, electricity generation and distribution system, solid and hazardous waste management facilities etc.), internal roads, and basic infrastructure for the Complex.

CC must operate in accordance with the mitigation measures stipulated in this EIA report. CC report to the Project Owner.

Responsibilities of CC during construction phase include:

- Implement environmental mitigation measures for the construction activities and work camps as required by DRC;
- Liaise and coordinate with DRC on matters related to environment and public consultation; and
- Develop emergency response plan and establish emergency response capability for construction phase, which may include accidents, fire and first aid and medical evacuation.

## **8.7 PROJECT POLICY**

### **8.7.1 Policy**

The Project Proponent refers to Dawei Residence Company Limited (DRC), which falls under the category of 'Developer' according to Myanmar Special Economic Zone Law (2011). DRC roles in the project include design, construction, and operation of infrastructure and amenities in the Initial Township. DRC will be responsible for technical planning, enforcing, and monitoring of all environmental mitigation measures as stipulated in the EMP. The Project Owner reports to the Governing Body.

#### **8.7.1.1 Construction Phase**

Responsibilities of DRC prior to and during construction phase include:

- Hold discussions with the government agencies to develop procedure for inter-agency coordination and reporting;
- Ensure that provision of relevant environmental mitigation measures are reflected in the contract between DRC and construction contractors;
- Develop monitoring programs and monitor the implementation of environmental mitigation measures for construction period; and

- Liaise and coordinate with government agencies on the matters related to environment and public consultation.

### 8.7.1.2 Operation Phase

Responsibilities of DRC during operation phase include:

- Establish environmental requirements for the industrial estate following the mitigation measures for the operation phase;
- Distribute the environmental requirements to the factories/manufacturers and ensure that the factories/manufacturers comply with the environmental requirements both during construction and operation of the facilities;
- Operate the utility systems of the industrial estate including electricity generation, water treatment and distribution, solid and hazardous waste management, and wastewater treatment system;
- Develop emergency response plan and establish emergency response capability for operating phase, which may include traffic accidents, fire and chemical pollution incidents within the industrial estate area;
- Develop monitoring programs and monitor the implementation of environmental mitigation measures for operating phase; and
- Liaise and coordinate with government agencies on the matters related to environment and public consultation.

### 8.7.2 Environmental Management System

DRC as the project owner has to establish the environmental policy and rules that will govern environmental practices and performance of the Initial Township as a whole. The establishment and implementation of this component is of utmost important due to absence of local environmental regulations and authorities fully responsible for environment and pollution control in Myanmar. Once established, DRC shall adhere to these policy and rules. However, in the future, when the environmental protection laws may be announced and published by the Government of Myanmar, DRC shall ensure that the requirements as set in the policy and rules are fully in compliance with the laws.

Environmental policy and rules for Initial Township shall be based on the following principles:

- Eco city concept which have the following key components:
  - Integration with natural system.
  - Maximize energy efficiency through facility design and other means.
  - Material flow through the whole area and ensure maximum reuse and recycling.

- Water conservation, reuse and recycling in the Initial Township.
- Prepare Environmental, Health and Safety Plan. EHS management plan or programs should also be reassessed periodically to ensure that the key environmental health and safety risks are determined in accordance with changes in order that the potential risks will be appropriately addressed. Thus, EHS system and performance should be improved continuously by a combination of ongoing monitoring of the Initial Township and high performances as well as effective accountability of the facility
- Establish *Environmental Rules* that the township has to follow. These rules will be in accordance with the EMP for operation period. The rules will be attached with the contractual document between the contractor, operator and DRC.

In addition to the above policy and rules, DRC will play a leading role in maintaining and improving overall environmental performance of the whole Initial Township. The EIA was prepared in a broad scope to cover all possible activities in the Initial Township in high level. DRC will have to establish a strong organization to handle the dynamic and changes that will occur during the construction and operation of the project. To achieve environmental safety and health management goals, to protect the environment, workers and the public from any adverse impacts caused by the project, the strong environmental management commitments and the proficient mitigation measures are needed. In order to develop the comprehensive environmental management plan, DRC as the project owner should be aware of the change during the operation period, and should consider the following measures.

- DRC should establish a sector responsible for safety health and environmental management of the Initial Township to prepare and perform the environmental management plan and programs to ensure that the Initial Township comply with environmental legislation and other relevant safety health and environmental requirements, and to achieve the most up-to-date environmental protection requirements/ measures/ standards.
- DRC should periodically assess/reassess the environmental management plan or programs to ensure that the key environmental health and safety risks are evaluate.
- Due to the long period of the Initial Township Project, DRC should ensure that EHS performance will be improved continuously via a combination of ongoing monitoring program and cooperation with the residences and community mall inside the Initial Township.
- DRC needs to prepare and commission a database system to keep track of and analyze environmental data, flow of materials and waste, water consumption, wastewater generation rate and quality, and energy consumption. The database will help organize the data from monitoring program of DRC and of the township, and can also be used as a tool to

promote conservation of material, energy, and water among the township, if the database is designed properly.

- DRC should provide provisions to ensure that the project can apply proper environmental health and safety management to protect health and safety of workers and the public.

### **8.7.3 Mitigation Measures Commitments**

The Project commits to comply with all mitigation measures as stated in the Environmental Management Action Plans during construction phase and operation phase.

## CHAPTER 9

# PUBLIC CONSULTATION AND DISCLOSURE

Sustainable development is a result of economic, environmental, and social values integration. Therefore, the public involvement and disclosure is a part of environmental assessment process. The importance of civil society participation has been recognized in international environmental law and policy, most prominently in Principle 10 of the Rio Declaration on Environment and Development which states that “*Environmental issues are best handled with the participation of all concerned citizens, at the relevant level*”<sup>1</sup>.

In accordance with the Myanmar Environmental Impact procedure (2015), participation of public and information disclosure are a part of the process. It is requested the project proponent to provide opportunities of public to express their opinions, concerns, recommendation and suggestion in developing the project. The public participation and information disclosure are international practice and have long been used as a tool to assess concerns of the stakeholders. Therefore, herein the Dawei Initial Township Project implements the public consultation.

### 9.1 PURPOSE OF THE CONSULTATION DURING THE PREPARATION OF EIA REPORT

The purpose of public participation and disclosure are;

- to inform the stakeholders about the project,
- to gain public views, concerns and values,
- to increase public confidence, and
- to improve transparency and accountability in decision-making process.

### 9.2 METHODOLOGY AND APPROACH

#### 9.2.1 Identification of Stakeholders and Group Affected by The Project

According to ADB Environmental Assessment Guideline and standards of the World Health Organization (WHO) and the Industry Foundation Classes (IFC), there are 5 categories of stakeholders; local communities, civil society, government bodies, private sector bodies, and other institutions. By adjusting such guideline and standards into practice in Myanmar

---

<sup>1</sup> THE UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT. Year. Rio declaration on environment and development. *In*: Report of the United Nations conference on environment and development, Rio de Janeiro, 1992. 3-14.

context, the key stakeholders of this project are divided into two main groups; 1) the regulatory authorities and 2) local stakeholders. The regulatory authorities and public/ private agencies include Provincial Authorities, District Authorities, and Dawei Special Economic Zone supportive group. The local stakeholders include villagers in the Initial Township project area. Therefore, the public consultations of this report already covered the primary stakeholders who are directly affected in positive and negative way.

The target groups for public consultation included 2 villages that will be the location of the Initial Township. These 2 villages are Min dut and Pagaw Yun.

### **9.2.2 Methods of Consultations**

According to ITD has delegates the United Analyst and Engineering Consultant Co., Ltd. as the consultant of this project. The consultant has sub-contracted “Resource & Environment Myanmar Ltd.” (REM) as a local company and a sub-contractor to conduct meetings with local stakeholders. The reasons to select REM include their experiences in EIA study, their professional staffs and the familiar of Dawei Projects; in addition, REM can cooperate and engage with local stakeholder better than non-local company. REM started conducting projects since 1998. Also, they have been involved in Dawei Sea Port, Main Road, and Dawei Industrial Estate projects; therefore they are well familiar with the area.

Thai consultant designs the public involvement process, defines stakeholders, and conducts presentation for REM. REM is responsible for coordinating with government permission process, inviting participants, managing public consultation meeting, and recording raw data. The guideline to arrange public consultation meeting is provided to REM to ensure that all necessary steps were conducted. Communications between the consultant and REM have been conducted via phone, email, and face-to-face meeting to safeguard the mutual understanding. The consultant also observed some meetings to ensure that the meeting process was correctly conducted.

To recruit the participants of each meeting, REM used the traditional process to invite people. Firstly, REM coordinator called the head of village and informed him/her about the meeting and objective of meeting as well as to make appointment for date and place of meeting. The head of village later disseminated this information to the people who are interested to involve in the meeting.

In the public consultation process, the REM staffs firstly introduced themselves and the consultant to local people. Secondly, REM briefly informed about the project information. PowerPoint Presentation was used to show some pictures. The PowerPoint was conducted by the consultant and REM translated the content to Myanmar language. Regarding ADB Environmental Assessment Guideline, public consultation involves engaging people in dialogue, a two-way flow of information and ideas between the project proponent and the stakeholders with opportunity for the stakeholders to express their views and concerns. Thus, REM staffs asked the participants whether they had any questions or concerns related to the project. All concerns were recorded and translated to English by REM staffs. It is very essential

to clearly notify that only concerns related to Initial Township project were taken into consideration in this Chapter.

### **9.2.3 Approach to The Public Meetings**

The following approach to the public meetings was adopted;

- Each meeting at the community level was organized by the consultant in Myanmar namely “Resource & Environment Myanmar Ltd. (REM)” to confirm that the stakeholders feel free to express their concerns towards the project. The meetings were also conducted in local language to ensure that the stakeholders clearly understand the provided information.
- REM firstly contacted headman of each village to make appointment of the meeting. Headman of each village had identified participants to be invited, and in making arrangements for the meeting venue and issuing invitation.
- The project proponents and UAE (Thai consultant) were responsible for providing information on brief project information including development plan, EIA study as well as potential impacts of the projects and mitigation measures to minimize the impacts. This information was translated to local language by REM. The project proponent, UAE, and REM had worked as a project team.
- The meeting began by informing the participants of the objectives of the meeting and expected outcome. After that, the project team gave information about the project and EIA.
- The meeting then provided an open forum for discussions. The participants expressed their concerns, offer their views and suggestions.

## **9.3 SUMMARY OF CONSULTATION ACTIVITIES UNDERTAKEN**

The Project conducted the public consultation program 3 times during the environmental impacts assessment process. The first consultation (Early program) were carried out during 2012 and 2013. To inform public overall about the entire initial industrial estate that included the initial township information, potential impacts and mitigation measures (Annex 9-1). The second consultation (Middle program) was in 2015 so focus on the initial township itself and have details following:

### **9.3.1 Public consultation program in 2015 (Middle)**

The public consultation meeting was conducted during 21-22 March 2015. The Project information were presented and disseminated to PAPs by handouts (Annex 9-2). The Project proponent also carried out opinion survey using questionnaire (Annex 9-3).

**Figure 9.3-1 The Second Public Consultation during March 2015**

To begin with, the consultant visited Dawei Working Body to introduce consultant team and to inform about the public consultation meeting. After receiving permission from the government, the meetings were conducted with 122 people in 2 affected villages. The date, place, stakeholder group, and number of participants involved in the public consultation meetings are shown in Table 9.3-1.

**Table 9.3-1 Date, Place, Stakeholder Group, and Number of Participants in the Public Consultation Meetings**

No	Date/Time	Village	Number of Participants
1	21 March 2015 10.00 hr	Min dut	66
2	22 March 2015 10.00 hr	Pagaw Yun	56
<b>TOTAL</b>			<b>122</b>

Source: REM (2015)

### 9.3.1.1 Summary of main comments received from stakeholders

After receiving information of project, the participants expressed their concerns about the project as follows;

(1) Min dut

- The villagers are worried that the project might lead to water pollution and they will not able to drink water from village's well. Thus, the project owners

must be careful and the project activities should not harm their water resources.

- The villagers complained that they cannot use the stream besides the project because the project bulldozes the stream. Consequently, the villagers cannot grow any crops or trees because the stream is too shallow. The villagers requested the project owner to disinter the stream if possible.
- The villagers would like to be employed in the Initial Township project. Thus, they requested for the technic training program concerning with this project.
- The local people want to use the villages' existing road after the project is done.

## (2) Pagaw Yun

- The villagers are concerned about seven groups of temporary workers in oil-palm garden. If the garden is eradicated, they will have no place to live.
- The villagers are confused about the management of existing oil-palm garden. The government informed them that the government will leave 350 oil-palm trees. However, ITD informed them that all oil-palm trees will be cut off. The villagers want to retain some oil-palm trees to keep the region green and to be a buffer zone of the project.
- The villagers would like to know about the actual plan that will not be changed again and again.
- The villagers are worries about the environmental pollutions caused by Initial Township project.

To conclude, the concerns towards the project are listed as follows;

- Environmental impacts such as water pollution
- Local employment and career training program
- Public information

### **9.3.1.2 How these comments were taken in account**

The project proponent took these concerns into account and the mitigation measures to minimize the public concerns are addressed in the next section. For the result of the public consultation meeting can be defined the mitigation measures for the public involvement and disclosure in construction phase and operation phase as shown in Table 9.3-2 and Table 9.3-3.

**Table 9.3-2 Mitigation measures for construction phase**

Mitigation Measures	Place	Period	Responsible Agency
1. Inform head of villagers about construction plan and activities	<ul style="list-style-type: none"> <li>• 2 Villages</li> </ul>	<ul style="list-style-type: none"> <li>• At least 2 weeks prior to the construction</li> </ul>	DRC
2. Local people can complain about the project activities directly to the complaint handling unit or via the community leader. The corrective actions of each complaint must be done within a month or at the period of time that developer and local people mutually agree	<ul style="list-style-type: none"> <li>• Via community leader house</li> <li>• Putting complaint in the comment boxes</li> <li>• Oral inform at complaint handling unit</li> </ul>	<ul style="list-style-type: none"> <li>• Over construction phase</li> </ul>	DRC
3. Provide on-site construction skill training for local people and give them wages at least those indicated by Myanmar labor law	<ul style="list-style-type: none"> <li>• At the construction site</li> </ul>	<ul style="list-style-type: none"> <li>• On-site training</li> </ul>	DRC

Source: EIA Study Team

**Table 9.3-3 Mitigation measures for operation phase**

Mitigation Measures	Place	Period	Responsible Agency
1. Inform head of villagers about the operation plan and activities in the operation phase	<ul style="list-style-type: none"> <li>• 2 Villages</li> </ul>	<ul style="list-style-type: none"> <li>• At least once a month over operation phase</li> </ul>	DRC
2. Local people can complain about the project activities directly to the complaint handling unit or via the community leader. The corrective actions of each complaint must be done within a month or at the period of time that developer and local people mutually agree	<ul style="list-style-type: none"> <li>• Via community leader house</li> <li>• Putting complaint in the comment boxes</li> <li>• Oral inform at complaint handling unit</li> </ul>	<ul style="list-style-type: none"> <li>• Over operation phase</li> </ul>	DRC

### **9.3.2 The Third Public Consultation Program (Final)**

#### **9.3.2.1 Objectives of The Public Consultation Meeting**

The ESIA was approved on 25<sup>th</sup> October 2017. Thus the Project organized the public consultation again on 28<sup>th</sup> March 2018. The objectives of the public consultation were to introduce the project information and to inform about EIA study, potential impacts, and mitigation measures to the local stakeholders as well as to gather recommendation for future cooperation.

#### **9.3.2.2 Schedule and Stakeholder Group**

The public consultation meeting was conducted on 28<sup>th</sup> March 2018. The consultation is hosted by the Environmental Conservation Department (ECD), MONREC. The consultation held in DSEZ MC Auditorium in DSEZ between 8.30 am and 12.00 am. The handout presentation (Annex 9-4) were disseminated and handed to participants. One thousands and sixty stakeholders (not include the project proponent staff) were among government agencies e.g. Tanintayi regional ministry, authorized agencies, Environmental Conservation Department, DSEZ management committee, CSO/ NGO and project affected villages are invited and participated. Details in the public consultation were noted in the Minute Of Meeting (MOM) in Annex 9-5 and result of the consultation can be summarized in Table 9.3-1.

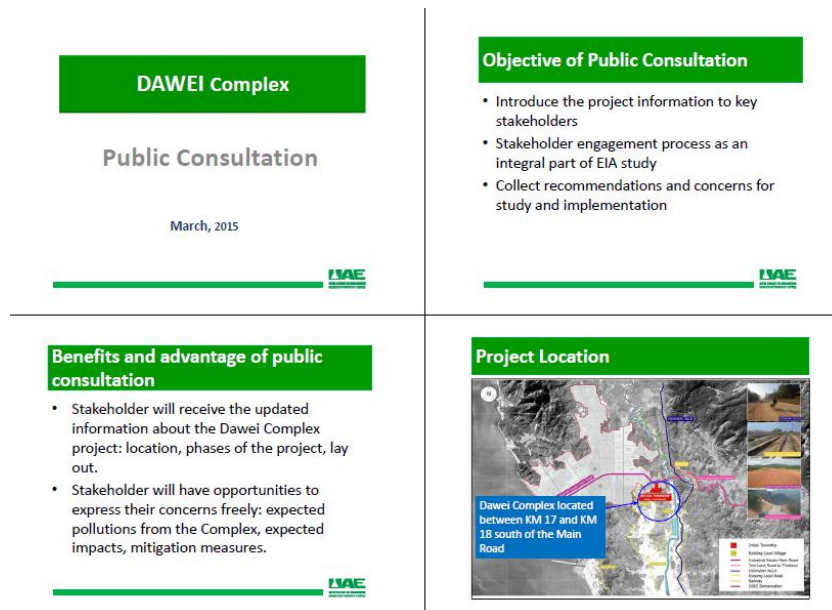

**Figure 9.3-2 Dawei DSEZ MC auditorium and participants in the final public consultation**

**Table 9.3-4 Summary of issues and response received from stakeholders in the consultation**

	Stakeholders	Issues	Responses
1.	Villager	Land acquisition, job opportunity and social issues	<p>Suggestion: He has attended various meetings since the start of the Dawei SEZ projects and also participated in various sessions on the land compensation and job opportunities events. So far, the main problem in job opportunities for local people is education. They are worried about insufficient skills and education. The CBO (Civil Base Organization) is a representative of local people organization. He would like to nominate himself in being the representative, in order to cooperate and negotiate between government agencies, Project proponent and local people on the land compensation, job opportunity and social issues. (Loud claps)</p> <p>Grievance and suggestion: In 2013, there used to have the CBO but somehow the problem occurred. Since then, there has none CBO anymore. So, now he wants the re-establishment of the CBO. He and villagers agrees with the Project proponent that the projects are well benefits and will be helpful for the local people and the region.</p>
2.	Villager	Project commitments and EMPs	<p>Question: "What are the Project Commitments and Environmental Management Plans?"</p> <p>Answer (by Ministry of Tannintayi Region): "The Dawei SEZ project is initiated by the previous government. Now we are democracy government elected by public, so you all can voice your opinions in our region. We are facing a demand of electricity and infrastructure in transportation. Thus, we do need the 2-lane road from Dawei to Tiki and, if the 2-lane road project is completely successful, Dawei will be so developed. The Tannintayi government has also a Master plan for the Dawei deep sea port which prepared by JICA (Japan International Cooperation Agency) and the ADB (Asian Development Bank) project loan for the 2-lane road. We will implement the Environmental Management Plans for Dawei SEZ projects by accountabilities of public opinions and responsibilities. We are welcome for your suggestions and comments."</p>
3.	Villager (Mudu)	Compensation	<p>Concern: "We are worried about compensation. The previous data collected 3 years ago, so it may be out of date. As well as the condition now is changed and very different. Number of households and villagers have been increased."</p> <p>Answer by Representative of the Dawei SEZ Management Committee (DSEZMC): "DSEZMC will establish Resettlement Compensation Committee (RCC) consisting of regional minister, government officers, village leaders etc. Previously, the DSEZMC had no experiences in the land compensation and did the wrong things. Now we are implementing in accordance with the international resettlement standard. We hired the international consultant ERM (Environmental Resource Management) to do a guideline for Resettlement Action Plan."</p>

## 9.4 DISSEMINATION OF PROJECT INFORMATION

Public consultation and information disclosure were conducted since the beginning stage of the EIA process through the ending stage, approval of the EIA. Each of the public consultation and meeting, objectives of EIA and the project details and mitigation measures were informed and communicate to the villagers through the Power Point Presentation and handouts type as shown in Figure 9.4-1 and in Annex 9-1, Annex 9-2 and Annex 9-4 both in Myanmar and in English.

Source: The EIA Study Team

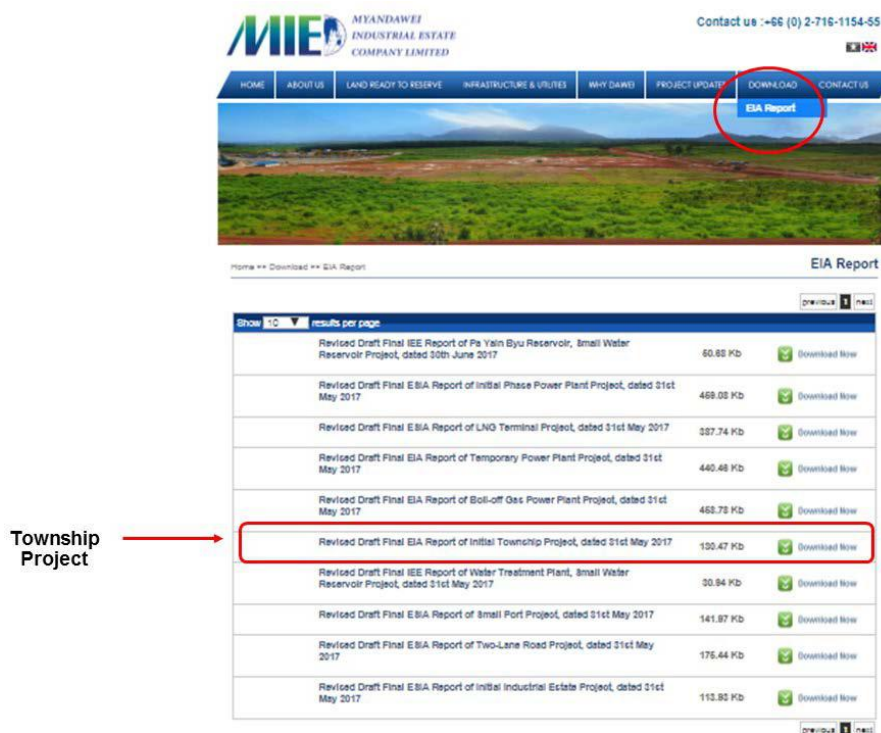

**Figure 9.4-1 The Project information communicated through the Power Point Presentation in the Public consultation meetings**

Outline of the Power Point Presentation are included;

- Objectives of EIA
- Updated Project location and layout
- Phase of the project, operation year, and targeted industries
- Potential impacts of the project
- Mitigation measures to minimize the impacts.

Furthermore, public can access and gain more the Project information and the EIA report on the MIE's website. The EIA Report has been published on the following website link: <http://www.daweiindustrialestate.com/download.php?cid=110&cname=EIA%20Report>.

Source: MIE (2017)

**Figure 9.4-2 Disclosure of the EIA Report on the MIE’s Website.**

## 9.5 RECOMMENDATION FOR FUTURE CONSULTATION

The major concerns obtained from the public consultation meetings included environmental pollutions from the project and their way of life after the project is implemented. Regarding environmental pollutions, the villagers are worried that the project might generate water pollutions and they cannot use water in the natural water sources.

In additions, they villagers are worried about their occupations after the project is implemented. Thus, they need a train program that can help them work in the industrial sector. The villagers also need to know about the actual project schedule and project description. Since the information has been changed all the time, they feel uncertain about their future.

The key recommendations from public consultations are to keep inform the villagers about project schedule, impacts, and mitigation measures to minimize the impacts from Initial Township as well as to provide appropriate training to the local people including establish committee, which will consist of government agencies, villagers and project proponent to organize and manage social issues.

## 9.6 RESETTLEMENT AND RELOCATION

According to the land use survey, the Initial Township is located in the plantation areas, which belong to government. Thus, none resettlement and relocation will be required. However, if there will have involve such resettlement or relocation in the future. The Project will comply by the relevant laws and regulation or the compensation as mentioned in Chapter 3 and the latest Resettlement Action Program.

## 9.7 SKILL TRAINING PROGRAM

To prepare the employment in the Initial Township and new business opportunities that come with the Project, short-term training should be provide in various skills that would be in demand in the Early Industry development. The project aims to establish the Dawei Skill Training Center to support demand of skilled workers pursuant the type of business that will raise in the Initial Township. This type of skill training will be agreement between employers and employee, in choosing the best program for themselves such as:

- Construction related skills including carpentry, painter and masonry;
- Motorcycle repair;
- Computer repair and home appliance repair;
- Small business management;
- Handicraft making
- Security Training
- Food Production Training
- Furniture Production Training
- Car Driving Course
- Electricity installation Course Training
- Car repairing Training
- Computer skill Training
- Language skill Training

Training program will legal establish in accordance with the relevant laws as mentioned in **Chapter 3**. The center will also authorize to conduct vocational training for works and staff including students; provide outsourcing services and agencies in the region. The Project aims to support the local and to enhance their job opportunities within the Township itself and the initial industrial estate.

## **9.8 COOPERATE SOCIAL RESPONSIBILITIES (CSR) PROGRAM**

### **9.8.1 COOPERATE SOCIAL RESPONSIBILITIES POLICY**

The Company has a guideline for the Corporate Social Responsibility as follows;

- The Corporate Governance: The management system of the Company shall have efficiency, transparency, and accountability for the confidence of shareholders, investors, stakeholders and related parties and lead to the sustainable growth of the Company.
- The Business Ethics: The Company believed that moral in business operation can benefit the Company in the long-term. The Company will avoid engaging the activities which are against morality.
- The Respect to Human Right and Labor Equity: Human resource is the effective factor to drive the business and add value for the corporate. The Company, therefore, shall improve their working environment and provide them a chance to training for skill enhancement.
- The Responsibility to the Consumer: The construction business is high competition. The success of previous project and the satisfaction of the customer can benefit to the Company competitive advantage. The Company, therefore, shall maintain its standard of goods and services and can be the part of society to mitigate the social problems.
- The Community Development: The community's sustainability is one of the significant factors which can support the Company's business. The Company will establish the activities which can strengthen the community for example the education support, human resource development, employment creation, and other development project.
- The Environmental Concern: The people nowadays concern for the environment. The operation with suitable environmental impact protection system can help the Company timely complete the project. The Company, therefore, shall set the environmental impact protection system comply with laws and regulation and participate in environmental activities with other part of society.
- CSR Report: The Company will disclose the information related to CSR activities of the Company in the annual report.

### **9.8.2 COOPERATE SOCIAL RESPONSIBILITIES PROGRAM**

The Project plans to conduct CSR programs that will support development in Dawei region and local communities such social, environmental and standard of living. The program are

- Education;
- Natural Disaster Emergency;

### **9.8.2.1 Education**

The project aims to donate scholarships for students who live in vicinities of the project from school level until university level in every Q3 of every years.

### **9.8.2.2 Natural Disaster Emergency**

The project aims to donate and support the local communities or in the Dawei region during the emergency such as fire, natural disaster and epidemic or terrorism. The donation will conclude such life supporting bags and food and water and rescue equipment. Supports during recovery period, such as cleaning, clearing blocking drainages or cannels.

## CHAPTER 10

# CONCLUSION

Initial Township Project located in the Dawei Special Economic Zone (DSEZ) is planned to develop along with the initial industrial estate, the two-lane linked road, the water reservoir and treatment plants, the power plants, the LNG terminal and the telecommunication landline projects. Aim of the Initial Township Project is to support high-quality residences to accommodate both Myanmar people and the foreigners who work in the DSEZ.

Initial phase of the township will cover an area of 1.365 square kilometers. It can expand more in the final phase to serve up to 370,116 of people. Construction of infrastructure and phase 9+1 buildings consisting of 5-floor workforce apartment, 8-floor service apartment and may include 3-floor retails shop, is scheduled to start in 2018. The Project will develop by phase depending on demand of housing and residence in DSEZ. Utility system for the initial township will include power and electricity, water, waste management, flood protection and emergency response systems and the facilities center will include fire station, transportation hub and health care/hospital. Waste management will be operated and shared with the Initial Industrial Estate's waste management facilities.

The assessment of the environmental impacts includes reviews of the information and secondary data, site investigation, environmental baseline and socio-economic surveys and public consultation. Key potential impacts have been assessed and are summarized in Table 10-1. Although, adverse impacts on terrestrial ecology and land use are of the most concern cumulative impacts, the project area has already been encroached and largely used by expansion of community. Thus, mitigation measures including establishment of the buffer zone, enforcement, and education and campaign programs have to be conducted.

The other adverse impacts are on air and surface/groundwater quality. The project will be source of air emission during construction and from residents' vehicles will be mobile source during operation. Quality of surface water and groundwater have already been impacted by the activities of human settlement due to septic and seepage tanks still exists in a few places and most of the local households still use open pits for disposal. While, the project itself has onsite treatment unit to control effluent for each buildings and waste management systems, mitigation measures and monitoring program have to be followed up.

Initial Township has established EMP to address the potential impacts that may be caused by the project during both construction and operation phases. Together with an effective implementation of monitoring programs, the measures will help controlling the potential impacts to the acceptable level. However, many of the cumulative impacts and possible mitigation measures are considered to be beyond the scope and capability of the Initial Township to implement. Close cooperation with local and national government agencies will be required to address these concerns and to ensure that the potential impacts are predicted and appropriate measures are planned and implemented.

**Table 10-1 Key Potential Impacts**

Impacts	Proposed Action	Past Actions	Other Present Actions	Future Actions	Cumulative Impacts
<b>Physical Resources</b>					
Air Quality	*	*	*	*	**
Noise and Vibration	*				*
Surface Water and Sediment	*	*	*	**	**

Terrestrial Ecology	*	**	**	**	***
<b>Economic Development</b>					
Infrastructure Facilities	+				+
Traffic and Transportation	*			**	**
Land Use	***			**	***
<b>Social and Cultural Resources</b>					
Socio-Economic Conditions	+			+	+
Sites of Historical and Cultural Importance	**				**
Public and Occupational Health	*	*	*	**	**

Note: \* - low adverse impact      \*\* - moderate adverse impact      \*\*\* - high adverse impact  
+ - beneficial impacts

Cost estimates of the project already incorporated and provided budget provision to the important components for other environmental management and monitoring system; however, such budget estimates may be revisited when the project enters detailed design stage.

Public consultation activities have been conducted in Myanmar by local consultant with the villagers potentially affected by the project activities. Concerns of the public are the buffer zone to remain green area, water pollution and water for irrigation and employment by the industry. All the comments are taken in account via social mitigation measures i.e. inform of project activities and consultation, grievance redress and a training program to restore their income and employment.

## ENVIRONMENTAL MANAGEMENT PLANS

For each of the potential environmental impacts described in the ESIA report, various preventative measures proposed to mitigate different types of the impacts. This Environment Management Plans included details of responsible authorities, implemented parties, location, estimated cost including monitoring plans are prescribed here.

The key organizations responsible for implementation of the mitigation measures include: the Governing Bodies of the Government of Myanmar, the Project Proponent, the Construction Contractor and Sub-Contractors and the investors or tenants.

### 1.1 ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN

As enacted in the EIA Procedure, 2015. The two EMPs during construction phase and operation phase are defined as follows:

**“Construction Phase EMP** means a detailed and comprehensive Environmental Management Plan (EMP) for the construction phase of a Project. Such plan shall present all relevant commitments, Emission Limit Values, Environmental Quality Standards and other environmental requirements and include a description of the construction works, present an overview of Adverse Impacts, present mitigation measures and monitoring programs together with time schedules, overview maps, images, aerial photos, satellite image, site layout plans, cross sections, transects, environmental management and monitoring sub-plans for each construction site, thematic sub-plans, and management procedures as appropriate”.

**“Operation Phase EMP** mean a detailed and comprehensive EMP for the operational phase of a Project. Such plan shall present all relevant commitments, Emission Limit Values, Environmental Quality Standards and other environmental requirements and include a description of the construction works, present an overview of Adverse Impacts, present mitigation measures and monitoring programs together with time schedules, overview maps, images, aerial photos, satellite image, site layout plans, cross sections, transects, environmental management and monitoring sub-plans for each construction site, thematic sub-plans, and management procedures as appropriate”.

The above definitions make clear that the two EMPs required by MONREC will need to be comprehensive and have more details than very brief EMPs presented in EIA reports of the past. This requirement of MONREC is in line with current ESIA practices in developed countries. It should be noted that the two EMPs prepared as part of this ESIA study are invariably framework plans as they are based on outline designs of the Project. They are therefore intended to provide framework and prescribe requirements for the preparation of detailed CEMP and OEMP by the appointed EPC contractor (Contractor). Consequently, they could be considered and referred to as the Project Proponent’s or Owner’s EMPs to distinguish them from the Contractor’s EMP after the ESIA during project implementation.

## 1.2 EMP AND EMoP FOR CONSTRUCTION PHASE

As discussed in the EIA, the Project is not expected to have major environmental impacts during construction apart from environmental disturbances normally experienced in Township construction. Nevertheless, the Project Proponent will ensure that the Contractor will make best efforts to minimize the impacts during the construction phase despite their insignificant levels. In this regard, the Project Proponent will ensure that the Contractor-CEMP will incorporate all mitigation measures as prescribed in the Owner-CEMP in preparing detailed designs of the township and its associated facilities, construction methods, and specifications. CEMP is present as below:

### 1.2.1 Erosion and Sedimentation Action Plan

#### a) *Principle and Rational*

Construction and earth-moving activities accelerate erosion mainly by exposing areas of soil to rain and running water. If this runoff is not properly controlled, the result is often serious siltation of nearby watercourses. The consequences are degradation or destruction of fish and wildlife habitat, and water being less useful for freshwater supplies.

#### b) *Objectives*

To prevent soil erosion in the construction site into water resource and area nearby.

#### c) *Project Area*

Project construction area

#### d) *Description of Mitigation Measures*

CC shall prepare the Erosion and Sediment Control Plan for construction activities and submit to DRC for approval prior to commencement of construction activities in the area. The major effort at construction sites will focus on the management of erosion of excavated surfaces, especially during the wet season when the volume of runoff is expected to be high. The plan shall have the following components:

- An assessment of the potential for contamination of natural waterways. Basic principles include the size of the disturbed area, site drainage, and waterways receiving storm water from the disturbed area;
- Plans for water management during construction shall be established and include adequate drainage system to manage runoff from 2-year ARI storm flow;
- Sedimentation controls shall be implemented in the form of silt trap fences and sedimentation basins where appropriate, and all runoff from the disturbed area shall be directed to the sediment controls;

- Measures to be taken to collect, store and treat storm water prior to discharge from the site considering options for water re-use onsite;
- Management of material storage area – Stockpile and spoil disposal area shall not be located on drainage line;

Control of erosion and sedimentation shall be constructed progressively prior to commencement of each stage of earthworks until the permanent protection is established.

e) *Description of Monitoring Program*

DRC shall develop a monitoring program to include inspections of drainage works, sediment traps and other structures designed to treat water to reach an acceptable quality before discharge into natural and/or constructed watercourses meet the appropriate standard. The monitoring program for erosion and sediment control include:

- Inspect that erosion and sediment controls are in place prior to wet season,
- Inspect that the drainage system and sediment controls are functional during wet season,
- The sediment basins have a capacity of reducing the suspended solid from storm water by fifty percent (50%),
- Designate water quality monitoring plan to include locations of sampling upstream and downstream of the entry points of surface water runoff from construction area; frequency and methods of testing, and applicable standards for suspended solid.

A total of 6 sediment sampling stations similar to those surveyed during baseline sampling is recommended. Details of the stations and parameters are provided in Figure 1.2-1 and Table 1.2-1 but in 9+1 phase only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored

f) *Work Plan (Duration)*

During construction period

g) *Responsible Organizations or Agency*

CC under supervision by DRC shall develop and implement *Erosion and Sediment Control Plan* according to the site condition and progress of construction work.

DRC shall review and approve the *Erosion and Sediment Control Plan* before the construction in the area can be commenced, then inspect and monitor the implementation of *Erosion and Sediment Control Plan* according to the monitoring program. DRC shall prepare the report with the result of the implementation to MC every 6 months.

h) *Budget*

Included in construction budget.

## 1.2.2 Surface Water and Sediment Quality and Aquatic Biology Action Plan

a) *Principle and Rational*

Release of pollutants from construction activities, work camps, workshops, and chemical storage to the environment may affect quality of freshwater, coastal water, and sediment. Control of release is necessary to limit the potential impacts caused by such activities.

b) *Objectives*

- To prevent soil erosion and wastewater runoff into natural water resources.
- To prevent wastewater contamination from campsite

c) *Project Area*

Project construction area

d) *Description of Mitigation Measures*

The following mitigation measures need to be implemented by DRC and CC:

- Prepare and implement the measures for Erosion and Sediment Control.
- Prepare and implement the measures for Waste Management.
- Prepare and implement the measures for Construction Work Camps.
- Release of oil and grease from workshop facilities is prohibited. Used oil need to be stored separately and managed as per Waste Management Plan.
- Stock yards; gasoline, oil, lubricant and hydraulic oil storage areas; and machines/vehicles cleaning areas should be located at least 100 meters away from natural waterways.
- Used water shall be treated and disinfected before discharge into natural drainage

e) *Description of Monitoring Program*

Integrate monitoring program for inspection of mitigation measure implementation with relevant plans.

Additionally, it is recommended that the project continue sampling of surface water quality in Dawei River and Yalaib Chaung every 6 months, before and after rainy season, during the construction period for another 3 years so that the project has a more complete and continual baseline surface water quality before commencement of the Initial Township area.

In Full phase, a total of 6 sampling stations similar to those surveyed during baseline sampling is recommended. Details of the stations and parameters are provided in Table 1.2-1 and Figure 1.2-1 but in 9+1 phase only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored.

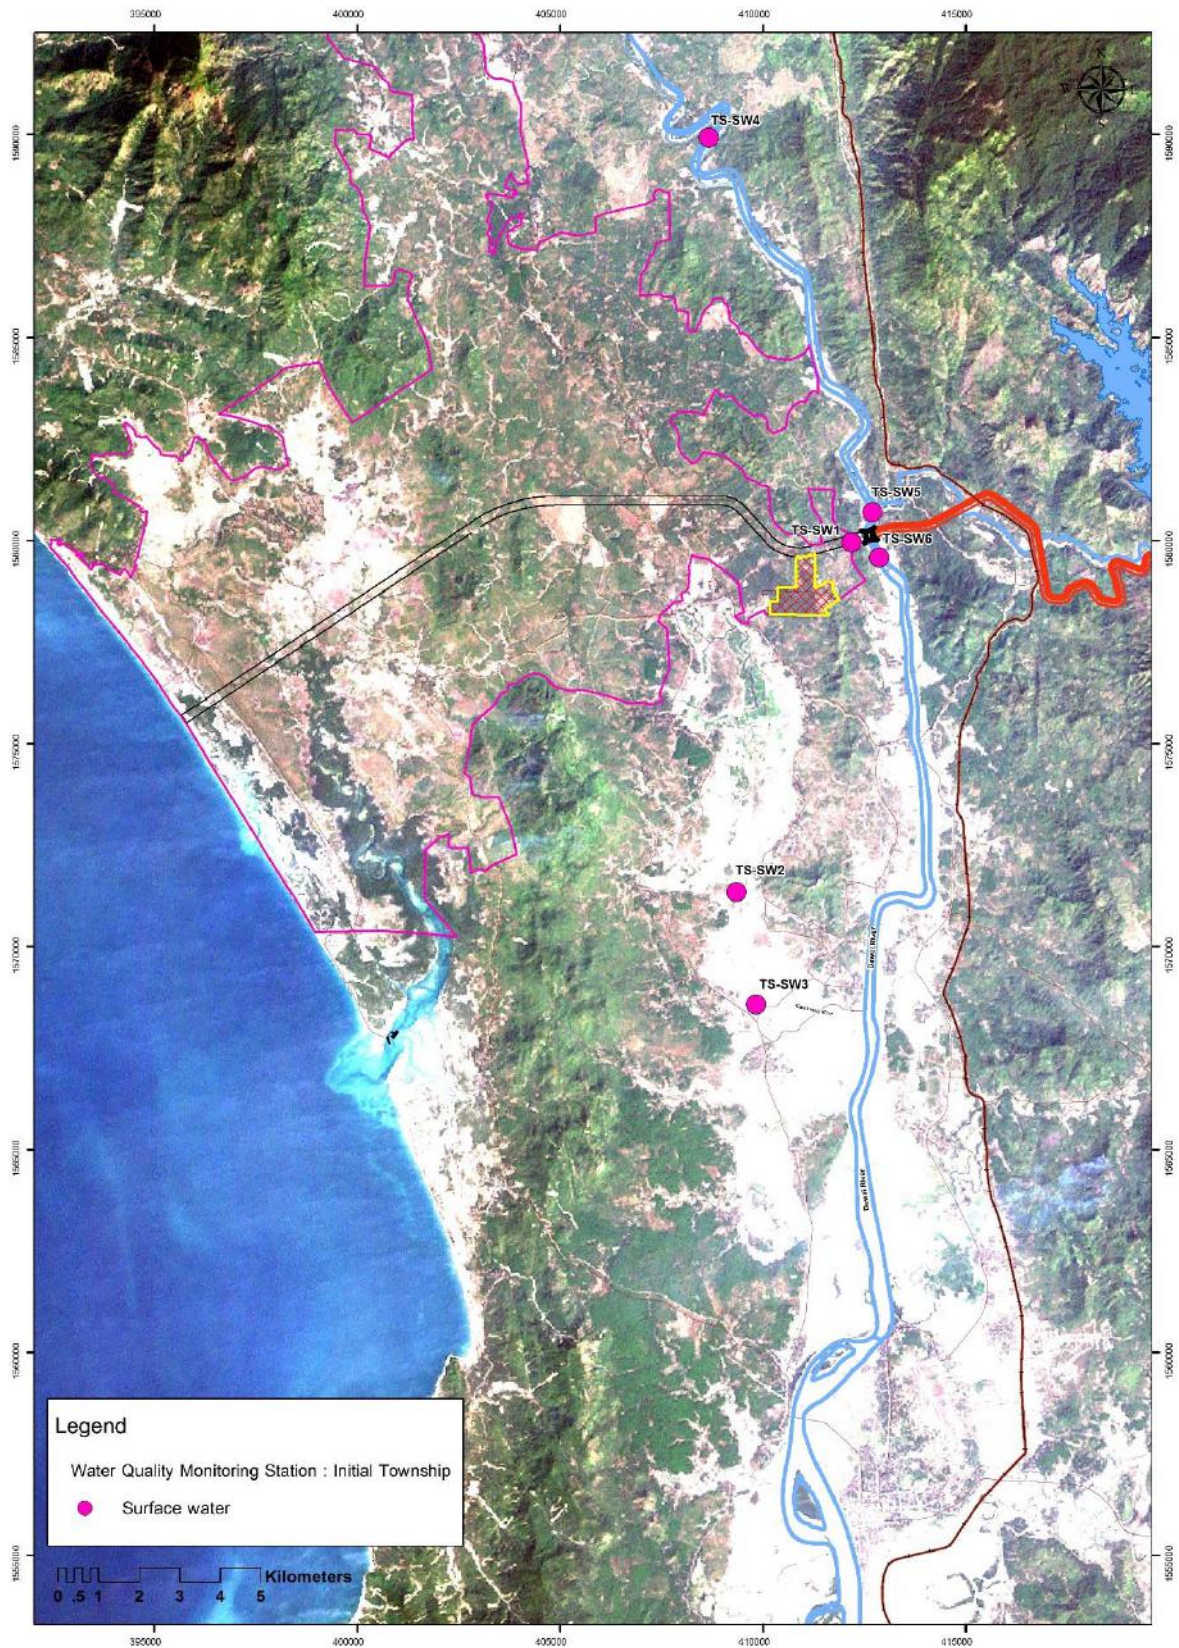

**Table 1.2-1 Analysis Methods of Surface Water and Sediment Quality Parameters and Sampling Stations During Construction Period**

Parameters	Analysis Method <sup>1/</sup>	Sampling Station
<b>Surface Water</b>		
Depth/ Width	Depth Meter	TS-SW1: Discharge point at the north of the project at KM 18+500 TS-SW2: Upstream at Yalai Chaung at meeting point of Yalai Chaung and canal(that receiving wastewater from discharge point at south of the project) TS-SW3: Downstream at Yalai Chaung at meeting point of Yalai Chaung and canal(that receiving wastewater from discharge point at south of the project) TS-SW4: Dawei River at the boundary of the project area at Ta Nyin In village TS-SW5: Dawei River (at about 500 meters upstream from the Yang Gaeng bridge) TS-SW6: Dawei River (at about 500 meters downstream from the Yang Gaeng bridge)
Temperature	Thermometer	
Flow Rate	Flow Meter	
pH	Electrometric Method	
Salinity	Electrical conductivity Method	
Electrical Conductivity	Electrical Conductivity Method	
DO	Membrane Electrode Method	
BOD	Membrane Electrode Method	
Turbidity	Nephelometric Method	
TSS	TSS Dried At 103-105 °C	
TDS	TDS Dried At 180 °C	
TS	TS Dried At 103-105 °C	
Nitrate-Nitrogen	Cadmium Reduction Method	
Ammonia-Nitrogen	Phenate Method	
Phosphate -Phosphorus	Ascorbic Acid Method	
TKN	Kjeldahl Method	
Oil&Grease	Soxhlet Extraction Method	
Phytoplankton	Microscopic	
Zooplankton	Microscopic	
Benthos	Macroscopic

**Figure 1.2-1 Sampling Locations for Surface Water , Sediment and Aquatic Biology Monitoring in Construction Phase**

f) *Work Plan (Duration)*

During construction period

g) *Responsible Organizations or Agency*

Refer to the relevant plan.

h) *Budget*

Approximately 48,000 USD/Year

### 1.2.3 Terrestrial Biology Action Plan

a) *Principle and Rational*

Although the much of the project area has been encroached by local villagers and used as farmland and residential areas. Attempts should be made to conserve the native plant species and minimize disturbance to sensitive environment.

b) *Objectives*

To prevent a natural forests, endangered plant species, native plant species and minimize disturbance to sensitive environment such as mangrove area.

c) *Project Area*

Project construction area and surrounding area

d) *Description of Mitigation Measures*

DRC needs to coordinate with CC to ensure that the measures below are incorporated in their construction plan.

- Only clear the area needed for construction of infrastructure and utility system. Avoid disturbance of forest and mangrove areas as much as possible.
- Wherever possible, identify the endangered species and transfer them to safe locations prior to clearing the vegetation.
- Hunting of wildlife is prohibited.
- Disturbance of forest areas outside the project area by CC and their subcontractors is prohibited.

e) *Description of Monitoring Program*

DRC will be monitoring the progress of construction work and vegetation clearing. Excessive vegetation clearing particularly prior to rainy season has to be minimized. Natural forests and mangrove areas that can be conserved throughout the construction phase has to be identified and signposted

f) *Work Plan (Duration)*

Vegetation clearing plan and detailed survey of endangered species has to be conducted before the area is cleared. The plan can be revisited throughout the construction period.

g) *Responsible Organizations or Agency*

DRC is responsible to identify the area where natural forest and mangrove can be conserved. DRC needs to consider further survey of endangered plant species identified in baseline environmental survey to map out their locations and numbers. DRC shall communicate the plan to CC for action.

h) *Budget*

Included in construction budget.

#### **1.2.4 Air Emission and Noise Control Action Plan**

a) *Principle and Rational*

Main potential impacts to air quality during construction activities are dust from construction areas (land clearing) and unpaved roads. Other sources include exhaust from machineries used in the construction activities. Main potential noise impacts are the diesel engine and pile driving or pavement breaking which may affect nearby communities and receptors.

b) *Objectives*

To reduce and control dispersion of dust and noise due to construction activity and to reduce air pollution emission and noise from construction machinery equipment. To reduce air pollution and noise impact on community nearby the area.

c) *Project Area*

Project construction area and surrounding area

d) *Description of Mitigation Measures*

DRC shall formally notify CC and enforce the following measures to reduce emission of air pollutants and noise from construction activities.

- All equipment and vehicles will need to be maintained in good mechanical conditions;
- Stationary noise sources (such as generators, concrete batching plants, etc) shall be sited as far as possible from villages, construction camps and resettlement areas;

- Construction works within the distance of 500 meters from villages and resettlement areas will be carried out between 06:00 to 18:00;
- Dump trucks with loads that may generate dust will be covered when travelling through communities;
- Water spraying at least once a day in the construction areas and on unpaved roads is required in the following conditions:
  - On the section of unpaved transportation routes that pass through communities or construction work camps;
  - When dust generating activities are being carried out within 100 meters of a village or construction work camp;
  - When visual inspection indicates excessive dust generation in the construction areas and unpaved roads used for material transportation and;
  - Limit vehicle speed to 40 m per hour when pass through communities;
- Burning of waste materials including waste vegetation from site clearing will be allowed under the following conditions:
  - The materials that are allowed to be burned are general garbage and vegetation waste. No burning of materials that may generate toxic gases is allowed;
  - A trained fire protection officer with appropriate firefighting equipment has to be present near the burning areas;
  - Burning is not allowed during severe wind conditions;
  - Burning is carried out at a safe distance from vegetated areas and not within 2 km. from a village, a construction work camp, or resettlement areas on the upwind direction;
- Avoid impact pile-driving where possible in vibration-sensitive areas. Drilled piles or the use of a sonic or vibratory pile driver causes lower vibration levels where the geological conditions permit their use.
- Construction workers exposed to noise levels of 80 dB(A) or more shall be provided with adequate Personal Protective Equipment (PPE) for hearing protection.

e) *Description of Monitoring Program*

DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program can be described as follow:

- Each construction machineries are inspected at least every 6 months with a written certificate / maintenance records of each machinery provided by qualified mechanics of the CC;

- Inspect that the dust suppression measures are implemented according to the mitigation measures;
- Inspect that the burning of waste materials are conducted according to the relevant mitigation measures;

Monitor the Community Grievance Record related to dust and noise and ensure that the complaints are responded to and closed appropriately according to the relevant mitigation measures

f) *Work Plan (Duration)*

During construction phase of the Initial Township.

g) *Responsible Organizations or Agency*

DRC shall ensure that the mitigation measures were distributed to and acknowledged by CC.

CC shall implement the mitigation measures under supervision of DRC.

DRC shall report the results of implementation to MC every 6 months.

h) *Budget*

Included in construction budget

### **1.2.5 Waste Management Action Plan**

a) *Principle and Rational*

A number of elements of the construction activities have the potential to generate waste that can have adverse effects on the surrounding environment in terms of water quality, soil quality, air quality (odor and pollutants) and human health. Waste can be both non-hazardous and hazardous waste. These wastes require different management methods. Lack of appropriate waste management facilities in the vicinity of the project area requires that the project needs to manage the waste generated from the construction activities by themselves.

b) *Objectives*

- To prevent and resolve waste and solid waste impact from the project.
- To minimize waste and provide guideline for solid waste management according to the law and regulation and appropriate method.
- To prevent and resolve impact from remaining solid waste. To get rid of bleeding area in solid waste storage location.

c) *Project Area*

Project construction area

d) *Description of Mitigation Measures*

DRC shall develop *Waste Management Plan* that will be applicable to all contractors in the project. The *Waste Management Plan* shall include the following components:

- Identify classification of waste. The minimum waste classification shall be non-hazardous and hazardous waste;
- Identify the size and location of the temporary hazardous waste storage area and non-hazardous waste disposal site for the construction phase of the initial township;
- A mechanism for coordination between DRC and CC in waste separation, waste transfer and record of waste quantity.
- Hazardous waste shall include, but not limited to, the following waste materials. Any mixed waste stream that contains any of the hazardous waste shall be categorized as hazardous waste:
  - Acids and acid waste;
  - Alkalis and caustic waste;
  - Batteries;
  - Spent catalysts, solvents, and chemicals;
  - Empty containers which held chemicals, paint, oil and solvents;
  - Oil contaminated waste including oily rags, oil filters, used gloves;
  - Used oil, hydraulic fluids, chemicals, and solvents;
  - First aid and medical waste;
  - Spill clean-up waste;
  - Waste from grease trap; and
  - Sludge from chemical wastewater treatment system.
- Hazardous waste shall be stored in appropriate temporary hazardous waste storage areas until the permanent hazardous waste management facilities for the operation phase is functional. Minimum requirements of the temporary hazardous waste storage areas include:
  - Impervious floor without cracks or spaces that may allow spills to perforate into the ground;
  - Surrounded by secondary containment bunds. The secondary containment bunds shall be at least 0.5 m high with a volume large enough to contain the spill of the largest container expected in the storage area;
  - Designate storage area for liquids or materials that are not allowed to be mixed, such as acids and alkalis;
  - Equipped with spill response kits;

- Consider providing the area with roofing and temporary walls with a provision that the temporary hazardous waste storage area will have to be in use for at least 3 years until the permanent hazardous waste management facilities of the initial township are functional.
- Type and quantity of hazardous waste in the storage area shall be recorded and kept up to date.
- Burning of the following non-hazardous waste is allowed: cardboard, pallets, papers, and wood/vegetation waste. The waste burning site shall be designated in the *Waste Management Plan* and shall be at least 2 km from any villages, construction work camps, or resettlement areas.
- Other non-hazardous waste shall be transferred to non-hazardous waste disposal site to be used during construction phase shall meet the following minimum requirements:
  - The disposal site shall be on higher ground not subject to flood.
  - The disposal site shall be at least 2 km from any groundwater well that is being used by workers or local villagers.
  - The disposal site shall be in the area where no excavation is planned. It shall be delineated with clear sign boards.
  - The waste shall be covered with soil on daily basis.
  - The location of all disposal sites during construction period shall be recorded as expanded appendices to the *Waste Management Plan*.
- Establish a training program for workers related to waste classification, storage and disposal.
- The *Waste Management Plan* may be expanded to cover recyclable waste and compostable waste in the future.

e) *Description of Monitoring Program*

DRC is responsible for monitoring that the CC is complying with the measures mentioned above. The monitoring program is described below.

- Inspect that appropriate containers for type of waste as categorized in the Waste Management Plan are provided for construction work camps, workshops, construction sites and other supporting facilities;
- Weekly inspection of waste segregation at the construction facilities and at the hazardous waste storage and non-hazardous waste disposal site;
- Weekly inspection of hazardous waste storage area and record of hazardous waste inventory.
- The location of waste burning area is designated and no waste burning is conducted outside the area;

- Waste management training record;

f) *Work Plan (Duration)*

During construction phase of the initial township

g) *Responsible Organizations or Agency*

DRC shall develop the *Waste Management Plan* to be implemented by both DRC and CC during construction phase.

DRC shall operate the temporary hazardous waste storage area and waste disposal site. DRC shall keep record of types and quantity of waste received to the temporary hazardous waste storage area and non-hazardous waste disposal site. DRC shall provide and keep record of waste management training program. DRC shall report the implementation of Waste Management Plan to MC every 6 months.

CC shall collect, separate, and transport the waste to the appropriate waste handling facility. CC to designate waste burning area.

h) *Budget*

Included in construction budget.

### **1.2.6 On-site Traffic and Access Management Action Plan**

a) *Principle and Rational*

Access roads used for transportation of construction materials and for traveling between construction sites overlap with the existing roads used by local villagers inside the project area. Roads are currently unpaved and have blind spots. Improvement of road safety conditions will be required.

b) *Objectives*

To control using for transportation of construction materials and for traveling between construction sites

c) *Project Area*

Project construction area and surrounding area

d) *Description of Mitigation Measures*

DRC as the project owner shall be responsible and instruct relevant CC to implement the following measures to improve access road safety conditions.

- All access roads in the construction area shall be signposted with the following information in Myanmar and English:

- Speed limit;
  - Construction activities and machinery;
  - Roadside borrow pits and material stockpiles;
  - Any applicable load limit, particularly for temporary bridges; and
  - Road features that may affect driving conditions such as curves, hidden accesses etc.
- A speed limit of 40 km/hr shall be applied in village areas and construction camps. Drivers shall be trained and notified of such limit;
  - Consider building speed humps before and after each village, where appropriate;
  - Route for heavy vehicles used for transportation of construction materials shall be designated. Route with least number of villages and residential area is most preferable;
  - Survey of the access roads to identify blind spots need to be regularly conducted. Improvement to the blind spots such as removal of obstructing objects when necessary; and
  - Access road used for the construction activities shall be maintained in good conditions.

e) *Description of Monitoring Program*

DRC is responsible for monitoring the above measures implemented by all parties. DRC shall coordinate with CC in selection of the most appropriate transportation routes that will contribute to least impact to the locals using the road for their daily travel;

f) *Work Plan (Duration)*

During construction phase of the township, until the permanent roads are completed

g) *Responsible Organizations or Agency*

CC responsible for construction and maintenance of the access roads shall be responsible for implementing the measures relevant to signposts and road improvement.

DRC and CC are responsible for using the designate routes for transportation of construction materials and traveling between construction sites. Speed limit needs to be respected and punishment system should be in place in case of violation.

h) *Budget*

Included in construction budget.

### 1.2.7 Construction Work Camps Action Plan

a) *Principle and Rational*

Construction work camps can be sources of wastewater pollution and health impacts. Thousands of workers are expected during the construction period, and proper management of the camps will be required to ensure that the potential impacts are controlled.

b) *Objectives*

To control sources of wastewater pollution and health impacts from work camps.

c) *Project Area*

Project construction area

d) *Description of Mitigation Measures*

It is assumed that DRC, CC and subcontractors will have their own compounds and camp management bodies. The following measures will be required for each of the worker camps in the project area:

- Camp rules shall be established and informed to all residences. The rules should contain the following components:
  - Policy on alcohol and substance abuse;
  - Safety measures and emergency response particularly in case of fire;
  - Waste management requirements;
  - Other measures to prevent dissemination of vectors and transmissible disease including STDs and HIV/AIDs;
- General areas of the camp shall be kept clean and tidy. Waste shall be collected regularly to avoid accumulation of waste in the camp;
- Toilets shall be provided at a ratio as 1 toilet per 15 workers. All toilets shall be equipped with septic and seepage tanks of adequate size. The toilets need to be at least 100 meters from any natural waterways. Sludge from tank cleaning shall be stabilized by adding lime (pH = 12 for 30 minutes) and disposed of in designated pit for sludge disposal. The pit shall be at least 1 kilometer from any groundwater wells
- Proper drainage has to be provided. Improve areas with stagnant water as much as possible; and
- Pest control measures shall be planned and implemented. All bedrooms need to be equipped with mosquito protection.

e) *Description of Monitoring Program*

DRC shall be the party inspecting the camps periodically to ensure that all the implementation are made

f) *Work Plan (Duration)*

Since the start of any construction work camp until end of its use

g) *Responsible Organizations or Agency*

All parties are responsible for managing their own camps in line with the above mitigation measures

h) *Budget*

Included in construction budget.

### **1.2.8 Historical and Cultural Resources Action Plan**

a) *Principle and Rational*

There are a number of sites with historical and cultural values in the project area. Each village also has at least one temple. Pagodas are observed in many places nearby the project area. Construction activities may disturb and damage these structures. Removal or relocation of these sites will be eventually required when the project is fully developed. If not handled properly, this matter will create significant conflict between local populations and the project.

b) *Objectives*

To reduce disturbing and damaging historical and cultural values in the project area.

c) *Project Area*

Project construction area and surrounding area

d) *Description of Mitigation Measures*

DRC as the project owner will need to take ultimate responsibility in handling the matter and ensure that CC understand the risk and follow the procedures and measures described below to reduce potential impacts with the communities.

- Inform ward/village general administrator if antiques object or ancient monument are found in the project area.
- Sites with historical and cultural values shall be identified, recorded and located in the map. This information shall be agreed upon by the local authorities and villagers.

- If construction activities have to be carried out within 50 meters from these sites, the leaders of the communities that the sites belong to need to be notified at least 1 week prior to commencement of the activities.
- Establish a plan and communication channel in case an unidentified site is encountered during the construction work to avoid damage to the site.
- Removal and relocation method and destination shall be a mutual agreement between DRC, local authorities, and the leader of the communities that the site belongs to.

e) *Description of Monitoring Program*

DRC needs to keep record and map up to date and make them available to all parties including CC and their subcontractors. DRC needs to monitor the construction work progress with the locations of known sites so that timely action can be taken if the sites will be subject to disturbance by construction activities

f) *Work Plan (Duration)*

All through the construction phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in construction budget

### **1.2.9 Public and Occupational Health Action Plan**

a) *Principle and Rational*

Construction activities can directly and indirectly affect the conditions of public and occupational health. Potential impacts include accidents, injuries, communicable diseases, increase in stress to the existing public health facilities, etc. Mitigation measures related to each aspect of public and occupational health are described below.

b) *Objectives*

To reduce accidents, injuries, communicable diseases, increase in stress to the existing public health facilities

c) *Project Area*

Project construction area

#### d) *Description of Mitigation Measures*

##### Occupational Health and Safety:

During the construction phase, DRC as the project owner and CC as the implementer should establish the preventive and protective measures to mitigate the potential occupational health impacts as follows:

##### *Accidents and Injuries*

- Establish occupational and safety management plan and program for the construction should be established to assess and manage EHS impacts and risks. Project or activity-specific plans or procedures should be prepared and the basic site rules of work should be included.
- Perform occupational accidents and disease recording and reporting, and investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.
- Provide contractor management plan to ensure that the contractor will have safety performances and procedures to protect their employee. Supervise and monitor contractor performance periodically.
- Train and provide information to employees. Occupational health training program should be provided as needed, for example, hazard awareness, specific hazards and safe work practices, to ensure that workers are capable of work safely.
- Provide appropriate personal protective devices to employee and ensuring that personal protective devices will be worn during working at all time.
- Restrict local community to access the site or area using fencing, signage and risks communication.
- Appropriately mark area signage and labeling of equipment , determine hazardous area for example, electrical rooms, compressor, etc., as well as installations, materials and emergency exits, and label in accordance with international standards, and easily to understand by workers, visitors and general public.

##### *Occupational, Sexual Transmission and Communicable Diseases*

- Supervise and monitor performance of contractors and sub-contractors on housekeeping in the campsite.
- Include training programs for workers with these following topics: health awareness, hygiene and sanitary, waste management, communicable and transmission diseases, cultural awareness, regulations and compliance, and drug abuse.

- Register foreign or migrated workers should be seriously performed to ensure that these workers have medical and health certificates to guarantee their personal health conditions.
- Conduct surveillance and active screening and treatment of workers. Immunization program may be required.

#### *Emergency Response and First-Aid*

- Establish emergency response plan and procedures which also should be in place for any remote sites. Emergency response plan shall be appropriate to change such environmental condition and natural disasters.
- Provide appropriate emergency services and personnel to expedite emergency response when needed, maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.
- Provide health services and first-aid unit at all time, with comprehensive and appropriate equipment, establish the qualified the first-aid unit to properly handle with serious or trauma cases, and sufficient to meet the requirements, treat and/or patients to appropriate medical facilities in time.

### Community Health:

#### *Housing and Sanitation*

- Provide sufficient infrastructure amenities and public health services in the campsite, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment.

#### *Environmental/Communicable Diseases:*

- In close collaboration with the community health authorities, implement an integrated control strategy for environmental and occupational diseases, such as integrated vector control programs, eliminating of breeding habitats in the campsite, and eradicating disease reservoirs.
- Collaborate with community health authorities to enhance the worker families to access public health services, and promote immunization.
- Distribute appropriate education materials for example health awareness, sexual transmission disease and communicable disease.

*Accidents/Fire/Chemical Leaks*

- Consider the level of local firefighting capacity to identify firefighting equipment that should be available when needed, and provide all necessary equipment with regular maintenance program.
- Communicate potential accidents and/or hazards to local authorities, communities and relevant parties.
- Conduct emergency response practices, including liaison with local response organizations and local responders.
- Revised or/and establish Emergency Response Plans as necessary according to changing of environmental situation including notify the Minister and Dawei Special Economic Zone Management Committee.

*Adequacy and Readiness of Healthcare Services*

- Provide the first aid unit at the campsite for their workers, assess whether the local health service capacity sufficient for worker's family and supporting industries, and in close collaborating with local authorities, consider supporting additional health service facility.
- Risk and impact to environment from construction of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.

e) *Description of Monitoring Program*

DRC will keep monthly update of health and safety statistics and records. Performance of construction health and safety is monitored against a set benchmark. DRC inspect health and safety conditions of the CC and subcontractor's construction sites and camps periodically

f) *Work Plan (Duration)*

Throughout the construction period

g) *Responsible Organizations or Agency*

DRC or Third party consultant shall ensure that the mitigation measures were distributed to and acknowledged by CC.

CC shall implement the mitigation measures under supervision of DRC.

DRC shall report the results of implementation for audit every 6 months.

h) *Budget*

Included in construction budget.

### 1.2.10 Public Participation and Dissemination

#### a) *Principle and Rational*

Public participation and information dissemination is apart environmental assessment process and sustainable development that will be result in economic, environmental and social values. General public idea about the project such as concerns of stakeholders, information and recommendation from public can be gathered through public meetings and social surveys which this information will be considered and can take accounted by DRC for further project management plans.

#### b) *Objectives*

To inform the stakeholders about the Initial Township project, gain public views, concerns and values, increase public confidence, improve transparency and accountability in the EIA decision-making process.

#### c) *Project Area / Stakeholders*

Project construction area and impacted area with various level of government agencies, relevant and responsible agencies, project impacted people, media and dependent organizations.

#### d) *Description of Mitigation Measures*

DRC shall establish public relation and public participation plan to incorporate in requests and recommendation of the continuous engagement of stakeholders following

- Inform about project activities to community
- Support nearby community as appropriate to build good relationship with community
- Communicate to build community understanding about
  - Construction activities and progress
  - Potential environmental impacts and mitigation measures
- Conduct by DRC consistent with the applicable standard for public meeting/consultation
- Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.
- Take account the results of the public consultation in improving and revised the EMPs.

#### e) *Description of Monitoring Program*

DRC will conduct public meeting or public relation e.g. using questionnaire or attitude survey for communities surrounded the Initial Township Project within 1 km in radius

of the project areas. The result must be report and the method must achieve acceptable standard and been carried out with representative samples with confidence statistics.

f) *Work Plan (Duration)*

Once for the entire construction phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in construction budget

### 1.2.11 Grievances Redress

a) *Principle and Rational*

For transparency and performance of the project in dealing with grieves that raise by communities and affected people. Grievance mechanism shall be implemented.

b) *Objectives*

To received grieves and complains from affected people or organization and manage the grieves effectively.

c) *Project Area / Stakeholders*

Project construction area and impacted area with project impacted people or impacted organizations.

d) *Description of Mitigation Measures*

DRC shall establish Grievance Redress Committee and Grievance Redress procedure to address any complaints / grieves to resolve / settle disputes that brought forward by community pertaining to project activities.

e) *Description of Monitoring Program*

Ensure that the grievance redress mechanism has been implemented. Complaints/grieves are systematically recorded and cases are settled.

f) *Work Plan (Duration)*

Once for the entire construction phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsile for this matter

#### h) *Budget*

*Included in construction budget*

### **1.3 EMP AND EMOP FOR OPERATION PHASE**

The operators refer to the investors build and operate their facilities in the Initial Township. Responsibilities of the operators, which will be during the operating phase, include:

- Comply with environmental requirements of DRC during construction and operation of their facility.

#### **1.3.1 Air and Noise Quality Action Plan**

##### a) *Principle and Rational*

Main potential impacts to air quality during operation period is exhaust from vehicles.

Noise from operation phase in the residential buildings and township area is similar with cities. It has no noise and vibration impacts.

##### b) *Objectives*

To control the main potential impacts to air quality during operation period is exhaust from vehicles and to not exceeding the relevant international standards.

##### c) *Project Area*

Project and surrounding area

##### d) *Description of Mitigation Measures*

Mitigation measures for air emission and noise can be listed below:

- Provide some space areas for tree planting within the project area.
- Care and maintain the trees planted; in case the trees are dead, shall plant trees to replace the dead ones.
- Install sign to notice that “Do not start the car while parking for waiting” at the parking area and reiterate the security guards to control strictly.
- Limit vehicle speed inside township area as 30 km/hr to mitigate possible noise impacts on nearby area.
- Install the “No Audible” sign within residential and township areas in obvious places.

- Plan for emission of GHGs from the Project shall be established and/or revised in concurrently with the relevant GHGs policy and regulations.

e) *Description of Monitoring Program*

No monitoring program is required

f) *Work Plan (Duration)*

Throughout the operation phase

g) *Responsible Organizations or Agency*

DRC is responsible to comply with the mitigation measures and prepare report and communicate with MC every 6 months.

The township operator is responsible to report the operating results to DRC every 6 months.

h) *Budget*

Included in operation monitoring budget

### **1.3.2 Waste Management Action Plan**

a) *Principle and Rational*

Waste generated from township is expected to be non-hazardous waste mainly. However, they can be essentially divided into 2 types: hazardous and non-hazardous waste. Waste management facility of Dawei Industrial Estate is expected to be complete at the same time as commencement of Early Industries Phase 2, which is in 2015-2016. The facility will be able to handle both hazardous and non-hazardous waste. However, prior to the commission of the facility, waste generated from Early Industries Phases will also have to be properly managed to reduce potential impact to the environment.

b) *Objectives*

To control leakage of waste from landfill site to the ground have potential to affect the quality of ground water and environment

c) *Project Area*

Project area

d) *Description of Mitigation Measures*

Nevertheless, the Initial Township will use the waste management facilities together with the Dawei Industrial Estate but the waste management facilities will be completed before the operation phase of the Initial Township.

- Design and construction of the landfill shall be in accordance with Solid Waste Disposal Facility Criteria – Technical Manual published by U.S. EPA (1993) or other applicable standards.
- Detailed hydrogeological condition of the proposed landfill area has to be studied in the design of landfill.
- Groundwater monitoring wells will be installed. As a minimum, 1 well is to be installed up-gradient of the landfill and at least 3 wells is to be installed down-gradient of the landfill. Depth of screens and well construction depends on the results from the hydrogeological condition study.
- The components of the waste management facility: i.e. sanitary landfill, secured landfill and incinerator shall be designed and constructed according to the internationally accepted standards.
- The facility shall create its Standard Operating Procedure covering steps from receiving waste, laboratory analysis, stabilization, temporary storage, incineration and disposal. Audit by third party is necessary.
- The landfill shall be closed daily to prevent vectors and odors.
- Classify hazardous and non-hazardous waste according to the definitions in the Waste Management Plan prepared.
- Workers need to be trained of Waste Management Plan.
- All hazardous and non-hazardous waste generated shall be transferred to the facility for disposal.
- Waste manifest system has to be created and implemented.
- Record of type of waste including its quantity shall be kept in the database of DRC.
- Waste Management Facility (if constructed in the landfill)

e) *Description of Monitoring Program*

Monitoring of environmental quality around the site is necessary. The monitoring requirements may be divided into each type of environmental matrix as follow:

- Groundwater monitoring:
  - Collect baseline groundwater quality before the operation of the landfill.
  - Monitor groundwater quality every month for the first 6 months and then every 6 months unless unusual concentrations are observed.

- For the waste management facility where hazardous waste stabilization and disposal is conducted, monitor the following parameters: pH, redox potential, dissolved oxygen, temperature, conductivity, turbidity and metals (cadmium, copper, lead, manganese, nickel, arsenic, selenium, and mercury).
  - Compare the results with Thailand's groundwater quality standards or other applicable international standards.
- Runoff and wastewater monitoring

The waste management facility is considered equal to a city area. The same requirements of wastewater management will be applied

f) *Work Plan (Duration)*

During the operation of the waste management facility

g) *Responsible Organizations or Agency*

DRC is the party responsible for operating the infrastructure and utility system and thus is the operator of the waste management facilities, both during Early Industries Phases and at full development stage.

h) *Budget*

Approximately 2,300 USD/year

### 1.3.3 Water and Sediment Quality Action Plan

a) *Principle and Rational*

Discharge of wastewater and release of waste materials to the receiving water have potential to affect the quality of water and sediment in both fresh water and marine environment. Organic loading in the treated wastewater may reduce the dissolved oxygen content in the receiving water to the point that is not suitable for living organisms.

b) *Objectives*

To prevent wastewater from project area runoff into natural water resources

c) *Project Area*

Project and surrounding area

d) *Description of Mitigation Measures*

The mitigation measures for water quality management are mainly consistent with wastewater and waste management system. However, specific consideration is proposed to further reduce the impact in the receiving water. The mitigation measures are discussed below:

- Prepare and implement the measures for Waste Management.
- Prepare and implement the measures for Wastewater Management.
- The discharged of untreated wastewater into the receiving water is strictly prohibited all time.
- Wastewater from the initial township operation shall be reused to water the trees planted in the initial township.
- Emergency plan for operation of wastewater treatment should be established to prevent untreated effluent discharged into the receiving water.

e) *Description of Monitoring Program*

The monitoring program can be conducted from freshwater and sediment.

Surface water and sediment

- Surface water and sediment qualities monitoring should be established. A total of 6 sampling stations similar to those surveyed during baseline sampling is recommended. but in 9+1 phase ,only 2 sampling stations are TS-SW2 and TS-SW3 will be monitored
- The parameter and sampling station of surface water and sediment quality monitoring are shown in
- and
- The surface water and sediment monitoring should be conducted at least 3 times a year (dry, early wet and end of wet season).

**Table 1.2-2 Analysis Methods of Surface Water and Sediment Quality Parameters and Sampling Stations During Operation Period**

Parameters	Analysis Method <sup>1</sup>	Sampling Station
<b>Surface Water</b>		
Water Level/Depth/Width	Depth Meter	TS-SW1: Discharge point at the north of the project at KM 18+500
Temperature	Thermometer	
Flow Rate	Flow Meter	
pH	Electrometric Method	TS-SW2: Upstream at Yalai Chaung at meeting point of Yalai Chaung and canal (that receiving wastewater from discharge point at south of the project)
Salinity	Electrical conductivity Method	
Electrical Conductivity	Electrical Conductivity Method	TS-SW3: Downstream at Yalai Chaung at meeting point of Yalai Chaung and canal (that receiving wastewater from discharge point at south of the project)
DO	Membrane Electrode Method	
BOD	Membrane Electrode Method	
Turbidity	Nephelometric Method	TS-SW4: Dawei River at the boundary of the project area at Ta Nyin In village
TSS	Total Suspended Solids Dried At 103-105 °C	
TDS	Total Dissolved Solids Dried At 180 °C	TS-SW5: Dawei River (at about 500 meters upstream from the Yang Gaeng bridge)
TS	Total Solids Dried At 103-105°C	
Nitrate-Nitrogen	Cadmium Reduction Method	TS-SW6: Dawei River (at about 500 meters downstream from the Yang Gaeng bridge)
Ammonia-Nitrogen	Phenate Method	
Phosphate -Phosphorus	Ascorbic Acid Method	
TKN	Kjeldahl Method	
Oil&Grease	Soxhlet Extraction Method	
TCB	Multiple Tube Fermentation Technique	
FCB	Multiple Tube Fermentation Technique	
E.Coli	Multiple Tube Fermentation Technique	

Remark: <sup>1</sup> APHA, AWWA and WEF. Standard Methods For The Examination of Water And Wastewater. 22<sup>nd</sup> ed. Washington, DC: APHA. 2012.

<sup>2</sup> United States Environmental Protection Agency. SW-846 Method.

**f) Work Plan (Duration)**

Throughout the operation phase

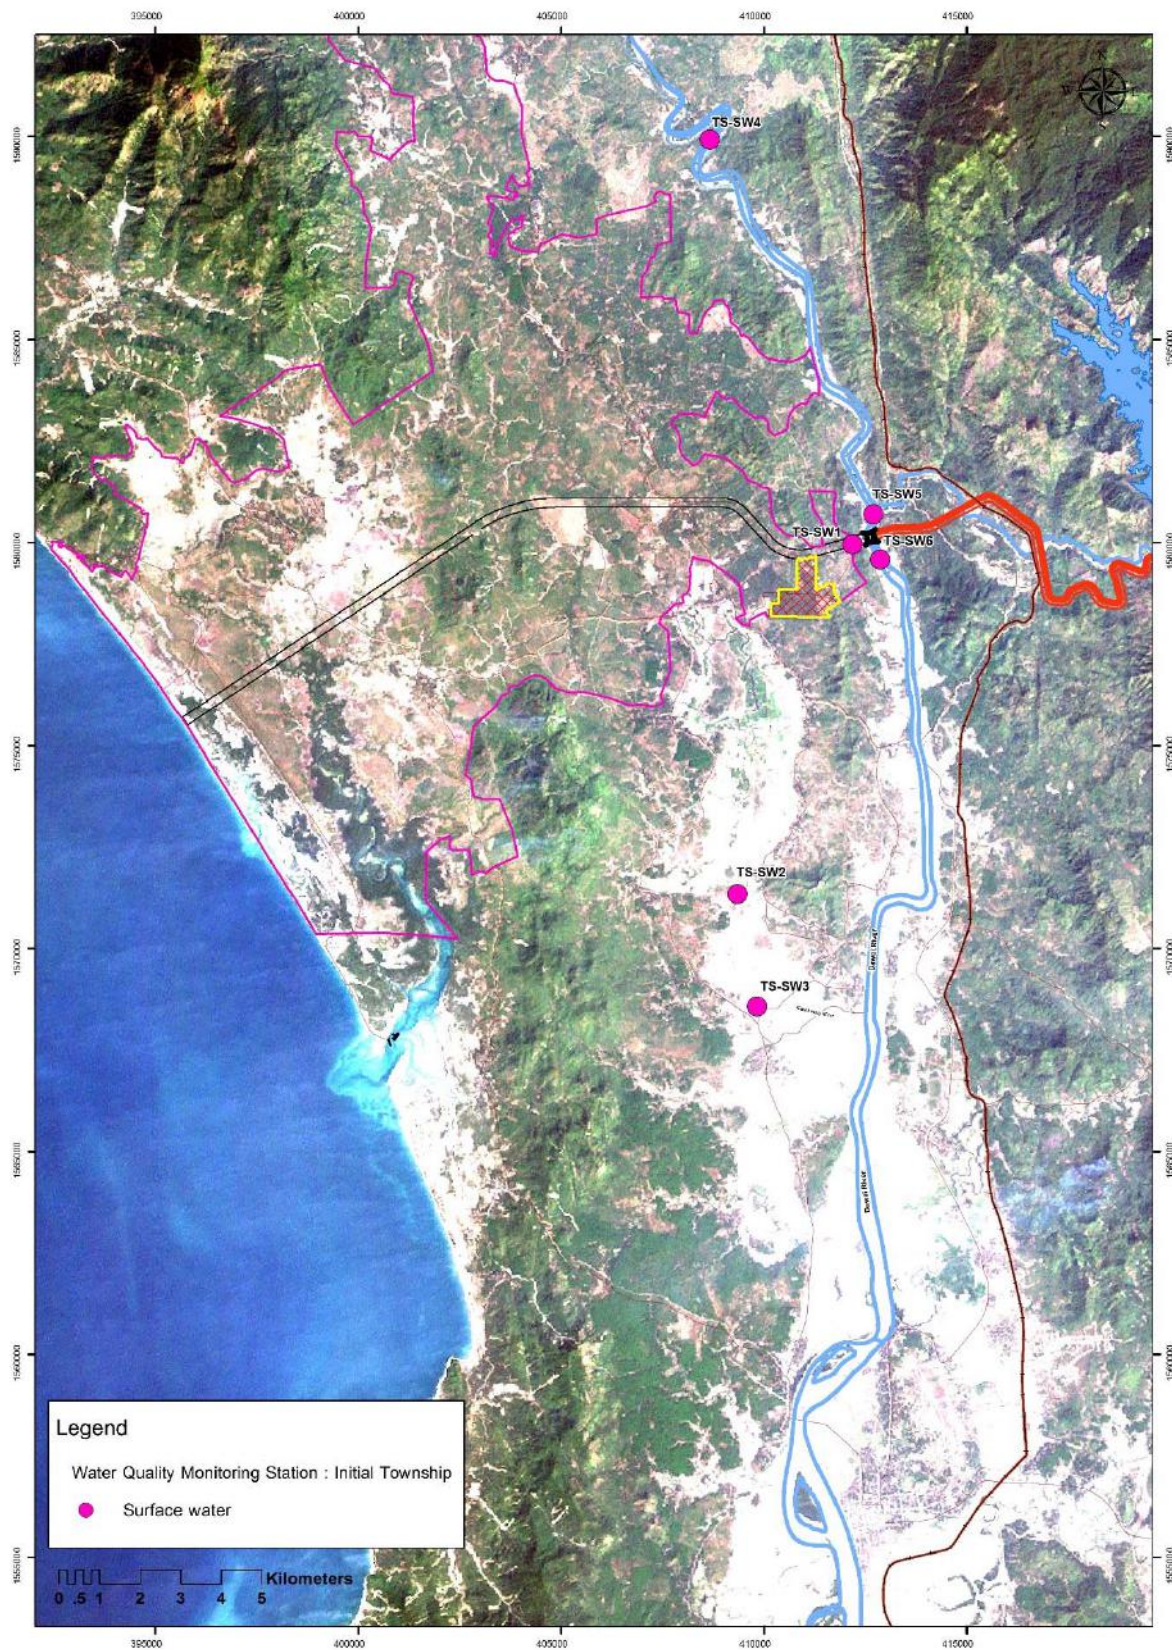

**g) Responsible Organizations or Agency**

DRC shall maintain overall ambient environment monitoring program and results.

The results need to be communicated with WC every 6 months.

**h) Budget**

Approximately 40,000 USD/year

**Figure 1.2-2 Sampling Locations for Surface Water and Sediment Quality Monitoring in Operation Phase**

### 1.3.4 Terrestrial Ecology Action Plan

#### a) *Principle and Rational*

Potential impacts to terrestrial ecology during operation phase are considered negligible. However, influx of workers from outside the area may result in increased demand of wildlife meat and poaching. Education and discouragement of consumption and domestication of wildlife need to be conducted all through the project life.

#### b) *Objectives*

To prevent waste from project area runoff into natural resources. And reducing impact to wildlife habitats or plants

#### c) *Project Area*

Surrounding area of the project

#### d) *Description of Mitigation Measures*

The mitigation measures for terrestrial biology is proposed as follow:

- Wherever possible, conserve the existing trees, particularly in the green areas,
- Coordinate with local authorities and engage local communities for reforestation projects surrounding the project area.
- Discourage and educate the workers towards wildlife consumption to reduce demand and indirect impacts to the wildlife in reserved forests elsewhere outside the project area.

#### e) *Description of Monitoring Program*

No monitoring program is required

#### f) *Work Plan (Duration)*

Throughout the operation phase

#### g) *Responsible Organizations or Agency*

DRC in corporation with the local authorities should promote the implementation of the above mitigation measures

#### h) *Budget*

Included in operation monitoring budget.

### 1.3.5 Land Use, Township and Community Management Action Plan

a) *Principle and Rational*

Change of land use surrounding the project area is of concern. Spontaneous development surrounding the township need to be planned and controlled.

b) *Objectives*

To control the effect to landuse changing and community

c) *Project Area*

In the project area only

d) *Description of Mitigation Measures*

#### Special Plan and Buffer Zone

A special specific area plan is needed to control the land use adjacent to the project area. The plan must be legitimate and authorized by the state. The purpose of the plan is to control land use nearby but outside the township and to prevent forming of temporary settlement growing outside the township area at inappropriate places. Moreover, a clear and marked buffer zone all around the township boundary should be set up to control and prevent any uses other than agriculture and forest. The size of the buffer zone should be determined by land use expert to ensure that in case of fire or other hazards, only a minimum number of people will be affected and rescue and relocation efforts will be with ease.

In addition, the town of Dawei, the nearest town and most likely place to be used for services to the non-local personnel, will be greatly affected by the estate and township development. A comprehensive plan authorized by the state for the future of Dawei is needed for appropriate growth. Otherwise, the project development will likely cause uncontrollable growth of Dawei resulting in degrading physical, uses and cultural condition of Dawei city in the near future.

#### Setting up a management committee overseeing the project land use.

A team or committee should be set up to monitor and manage activities and structures built in and around the project area. The purpose is to insure that those temporary service centers originated from basic needs and convenience of the workers are always in the appropriate places that will not obstruct or endanger the operation of the township. The team should have legitimate authority to control the areas adjacent or nearby, though outside the township boundary. Squatters must be notified that they are only allowed to operate temporarily and must be relocated when the time comes in order to prevent scattered temporary structures from evolving into unsuitable permanent settlements outside the initial area.

### Transportation and Infrastructure Outside the Initial Area

For the area immediately outside the township, not only land use should be controlled, but also other infrastructure that will enable setting up structures and services, such as, local roads, electricity, water supply and drainage, should be also well planned and controlled. The strategic locating or prohibiting of these basic infrastructure will induce and encourage early settlers and services outside designated township zone into the area planned by the management to provide temporary services in the early stage of development.

### Enforcement

The proposed set-up land use management committee/team should have duty to regularly monitor land use activities outside and inside the township area as the development progresses. Co-operation with local or state authority is needed to be able to control, direct, or enforce private buildings outside the project boundaries to prevent unsuitable and obstructing growth nearby the project area.

#### e) *Description of Monitoring Program*

The mitigation measures mentioned above a long-term and involve many parties in planning and implementing the land use surrounding the project to help ensure that on a longer term, communities will be located at a safe distance from the initial township and conflicts between both developments can be reduced

#### f) *Work Plan (Duration)*

Throughout the operation phase

#### g) *Responsible Organizations or Agency*

DRC through cooperation with local authorities.

#### h) *Budget*

Included in operation monitoring budget.

### **1.3.6 Public and Occupational Health Action Plan**

#### a) *Principle and Rational*

Operation phase of the project possess different risks to the workers and public. DDC as the owner of the project will need to have a program in place to handle the situations that may arise from the work-related illness and impacts in workers and local populations.

#### b) *Objectives*

To reduce risk and prevent danger and accident which may happen to worker and people transport or live in the operational area of the project.

c) *Project Area*

Project and surrounding area

d) *Description of Mitigation Measures*Occupational Health and Safety:

During operation phase, DRC or the project owner should establish the preventive and protective measures to mitigate the potential occupational health impacts as follows:

*Accidents and Injuries*

- Provide the environmental health and safety management system and programs for the whole initial township.
- Establish occupational health and safety management plans and programs to assess and manage EHS impacts and risks which are based on comprehensive job safety analyses.
- Include the following issues in the occupational health and safety management system:
  - Accident investigation, recording and reporting
  - Surveillance of the employee's health
  - Training and hazard communication
  - Monitoring and auditing procedures to evaluate the effectiveness of prevention and control measures
- Perform occupational accidents and disease recording and reporting, investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.
- Provide area signage and labeling of equipment in accordance with international standards and easily to understand by employees, visitors and general public.
- Promote traffic safety programs to all personnel, for example;
  - Improving driving skill
  - Use of speed control devices

*Occupational, Sexual Transmission and Communicable Diseases:*

- Conduct surveillance and active screening and treatment of employees. Immunization program may be required.

- Provide training programs for employees in these following topics: health awareness and promote health protection strategies including encouraging condom use.
- Perform periodic employee's health checks in accordance with the potential risks.

#### *Fire and Other Hazards:*

- Provide comprehensive emergency preparedness and response plan and procedures covering fire and other hazards control.
- Provide appropriate emergency services and personnel to execute emergency response when needed, and maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.
- Establish appropriate fire safety system to ensure its capability to cope with all the potential hazards.
- Conduct annual training and updating emergency preparedness and response plan to account for changes in equipment, personnel and facilities.

#### *Adequacy and Readiness of Healthcare Services*

- Establish the hospital in the township area, and periodically evaluate in terms of adequacy, capacity and readiness in accordance with the change in numbers of population in the township.

### Community Health:

#### *Sanitation*

- Provide sufficient infrastructure amenities and public health services for the township, for example accommodations, water and drinking water availability, solid wastes disposal and sewage treatment in order to reduce pressure on local authorities in servicing public.
- Technically support or collaborate with local authorities to enhance potentiality of communities in solid waste disposal by means of 3Rs (Reduce, Reuse and Recycle).

#### *Environmental/Communicable/Non-Communicable Diseases:*

- Establish the buffer strip/zone to separate the township and industrial estate to protect dwellers from pollutions emitted.

- Implement engineering preventive measures to install physical separation between industry and community, for example fence or tree plantation as buffer zone along the estate boundaries, and use of air modeling results and/or potential pollutions of each industry as the criteria for the distance between industries and affected community.
- Set up a grievance procedure to manage complaints, if any.

#### *Accidents/Fire*

- Invite representative of local emergency and securities services to participate in annual site inspections to ensure familiarity with the potential hazards present.
- Inform and communicate potential accidents that may impact to community to local communities and relevant parties.
- Prepare and train employees, people in township and nearby communities to respond to accidents, including providing technical and financial resources in order to control and response such events effectively and safely, and provide periodic emergency response practice with communities.
- Establish Emergency Response Plans in concordance with recent policy, law and regulation. Emergency response plan shall be appropriate to such current environmental condition and natural disasters and;
- Revise Emergency Response Plans as necessary according to changing of environmental situation including notify the Minister and Dawei Special Economic Zone Management Committee.

#### *Adequacy and Readiness of Healthcare Services*

- Promote collaboration with local authorities to enhance access of community to public health services for the employee's families and people being at residences in township to develop health service facility.
- Risk and impact to environment from operation of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.

#### *e) Description of Monitoring Program*

DRC will keep monthly update of health and safety statistics and records. Performance of operation health and safety is monitored against a set benchmark. DRC to periodic inspect health and safety conditions of the industry.

#### *f) Work Plan (Duration)*

Throughout the operation phase

g) *Responsible Organizations or Agency*

DRC shall establish EHS Plan expanding necessary components as listed above. DDC will be responsible for keeping all health and safety records and assessing health and safety performance of the township. DRC is the party coordinating with local authorities on behalf of the project in the matter related to health and safety of the township.

h) *Budget*

Included in operation monitoring budget

### 1.3.7 Employment and Training Program

a) *Principle and Rational*

Concerns from communities and the Project Affected People on skills necessary for employment including their job opportunities and employment condition during the operation phase in the township.

b) *Objectives*

To support locals for job opportunities and employment and skills training.

c) *Project Area / Stakeholders*

Project operation area and local communities and with project impacted people.

d) *Description of Mitigation Measures*

DRC shall conduct employment with IFC EHS General guideline/Laws and regulations in terms of the employee management and established plan for training programme and implement.

e) *Description of Monitoring Program*

Ensure that the standard of employment in accordance with relevant law and regulation are implemented. Employee has been trained as necessary.

f) *Work Plan (Duration)*

Every 5 years for the entire operation phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in operation budget

### 1.3.8 Public Participation and Dissemination

#### a) *Principle and Rational*

Public participation and information dissemination is apart environmental assessment process and sustainable development that will be result in economic, environmental and social values. General public idea about the project such as concerns of stakeholders, information and recommendation from public can be gathered through public meetings and social surveys which this information will be considered and can take accounted by DRC for further project management plans.

#### b) *Objectives*

To inform the stakeholders about the Initial Township project, gain public views, concerns and values, increase public confidence, improve transparency and accountability in the EIA decision-making process.

#### c) *Project Area / Stakeholders*

Project operation area and impacted area with various level of government agencies, relevant and responsible agencies, project impacted people, media and dependent organizations.

#### d) *Description of Mitigation Measures*

DRC shall establish public relation and public participation plan to incorporate in requests and recommendation of the continuous engagement of stakeholders following

- Inform about project activities to community
- Support nearby community as appropriate to build good relationship with community
- Communicate to build community understanding about
  - Potential environmental impacts and mitigation measures
  - CSR activity
- Conduct by DRC consistent with the applicable standard for public meeting/consultation
- Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.
- Take account the results of the public consultation in improving and revised the EMPs.

#### e) *Description of Monitoring Program*

DRC will conduct public meeting or public relation e.g. using questionnaire or attitude survey for communities surrounded the Initial Township Project within 1 km in radius of the project areas every 5 years. The result must be report and the method must achieve

acceptable standard and been carried out with representative samples with confidence statistics.

f) *Work Plan (Duration)*

Every 5 years for the entire operation phase

g) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsible for this matter

h) *Budget*

Included in operation budget

### 1.3.9 Grievances Redress

i) *Principle and Rational*

For transparency and performance of the project in dealing with grieves that raise by communities and affected people. Grievance mechanism shall be implemented.

j) *Objectives*

To received grieves and complains from affected people or organization and manage the grieves effectively.

k) *Project Area / Stakeholders*

Project operation area and impacted area with project impacted people or impacted organizations.

l) *Description of Mitigation Measures*

DRC shall establish Grievance Redress Committee and Grievance Redress procedure to address any complaints / grieves to resolve / settle disputes that brought forward by community pertaining to project activities.

m) *Description of Monitoring Program*

Ensure that the grievance redress mechanism has been implemented. Complaints/grieves are systematically recorded and cases are settled.

n) *Work Plan (Duration)*

Every 5 years for the entire operation phase

o) *Responsible Organizations or Agency*

DRC as the project owner is ultimately responsile for this matter

p) *Budget*

Included in operation budget

Summary of the Environmental Management Plan (EMP) are shown in Table 1.3-2 to Table 1.3-3 should be noted that the two EMPs prepared as part of this EIA study are invariably framework plans as they are based on outline designs of the Project. They are therefore intended to prescribe requirements for the preparation of detailed CEMP and OEMP by the appointed EPC contractor (Contractor). Consequently, they could be considered and referred to as the Project Proponent's or Owner's EMPs to distinguish them from the Contractor's EMP after the EIA during project implementation. Nevertheless, it should be noted that the planning and development of the Project has been dynamic throughout the study period. This includes also the organization of the project and other relevant agencies. The information used as the based scenario is considered the most valid one at the time of the report preparation. Changes to the project information may occur overtime and, therefore, readers and project implementers are advised to review at the time of the implementation.

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
Erosion and Sedimentation Control	<p>CC shall prepare an <i>Erosion and Sediment Control Plan</i> for construction activities and submit to DRC for approval prior to commencement of construction activities in the area. The plan shall have the following components:</p> <ul style="list-style-type: none"> <li>• An assessment of the potential for contamination of natural waterways. Basic principles include the size of the disturbed area, site drainage, and waterways receiving storm water from the disturbed area;</li> <li>• Plans for water management during construction shall be established and include adequate drainage system to manage runoff from 2-year ARI storm flow;</li> <li>• Sedimentation controls shall be implemented in the form of silt trap fences and sedimentation basins where appropriate, and all runoff from the disturbed area shall be directed to the sediment controls;</li> <li>• Measures to be taken to collect, store and treat storm water prior to discharge from the site considering options for water re-use onsite;</li> <li>• Management of material storage area - Stockpile and spoil disposal area shall not be located on drainage line and;</li> <li>• Control of erosion and sedimentation shall be constructed progressively prior to commencement of each stage of earthworks until the permanent protection is established.</li> </ul>	<ul style="list-style-type: none"> <li>• Inspect construction area every 6 months for the following:                             <ul style="list-style-type: none"> <li>- Erosion and sediment control are in place prior to wet season</li> <li>- Drainage system and sediment controls are functional during wet season</li> <li>- Sediment basins have a capacity of reducing the suspended solid from storm water by 50%</li> </ul> </li> <li>• Monitor water quality every 6 months for Total Suspended Solid in 2 locations; upstream and downstream of the entry points of surface water runoff from construction area.</li> <li>• Monitor sediment quality every 6 months following:                             <ul style="list-style-type: none"> <li>- 9-1 phase monitor 2 sampling stations (TS-SW02 and TS-SW03)</li> <li>- Full phase monitor 6 sampling stations in Figure 8.2-1</li> </ul> </li> </ul>	CC with DRC's approval
Surface Water Quality and Aquatic Biology	<ul style="list-style-type: none"> <li>• Prepared and implement the measures for erosion and sedimentation control, waste management, and construction work camp.</li> <li>• Release of oil and grease from workshop facilities is prohibited. Used oil need to be stored separately and managed as per the <i>Waste Management Plan</i>.</li> <li>• Stock yards; gasoline, oil, lubricant and hydraulic oil storage areas; and machines vehicles cleaning areas should be located at least 100 meter away from natural waterways.</li> <li>• Used water shall be treated and disinfected before discharge into natural drainage.</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor every 6 months before and after rainy season through the construction period or at least for 3 years of all parameters in Table 8.2-1 and analysis methods as indicated in Table 8.2-1.</li> <li>• 9-1 phase monitor 2 sampling stations (TS-SW02 and TS-SW03).</li> <li>• Full phase monitor 6 sampling stations as shown in Figure 8.2-1.</li> </ul>	CC with approval and under DRC's supervision

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
Terrestrial Biology	<ul style="list-style-type: none"> <li>• Only clear the area needed for construction of infrastructure and utility system. Avoid disturbance of forest and mangrove as much as possible.</li> <li>• Wherever possible, identify the endangered species and transfer them to safe locations prior to clearing the vegetation.</li> <li>• Hunting of wildlife is prohibited.</li> <li>• Disturbance of forest areas outside the project area by CC and their subcontractors is prohibited.</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor every 6 months progress of construction work and vegetation clearing in construction areas:natural forests mangrove areas.</li> </ul>	CC under DRC's supervision
Air Emission and Noise Control	<ul style="list-style-type: none"> <li>• All equipment and vehicles will need to be maintained in good mechanical conditions.</li> <li>• Stationary noise sources (such as generators, concrete batching plants shall be sited as far as possible from villages, construction camps and resettlement areas.</li> <li>• Construction works within the distance of 500 m from villages and resettlement areas will be carried out between 06:00 to 18:00.</li> <li>• Dump trucks with loads that may generate dust will be covered when travelling though communities.</li> <li>• Water spraying at least once a day in the construction areas and on unpaved roads is required in the following conditions:               <ol style="list-style-type: none"> <li>1. On the section of unpaved transportation routes that pass through communities or construction work camps;</li> <li>2. When dust generating activities i.e. from modification of topography of land are being carried out within 100 m of a village or construction work camp;</li> <li>3. When visual inspection indicates excessive dust generation in the construction areas and unpaved roads used for material transportation and;</li> <li>4. Limit vehicle speed to 40 km per hour when pass through communities.</li> </ol> </li> <li>• Burning of waste materials including waste vegetation from site clearing will be allowed under the following conditions:               <ol style="list-style-type: none"> <li>1. The materials that are allowed to be burned are general garbage and vegetation waste. No burning of materials that may generate toxic gases is allowed;</li> <li>2. A trained fire protection officer with appropriate firefighting equipment has to be present near the burning areas;</li> <li>3. Burning is not allowed during severe wind condition and;</li> <li>4. Burning is carried out at a safe distance from vegetated areas and not within 2 km from a village, a construction work camp, or resettlement areas on the upwind direction.</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>• Monitor every 6 months in construction areas following:               <ul style="list-style-type: none"> <li>- Inspection construction machineries with a written certificate:maintenance records of each machinery provided by qualified mechanics of the CC.</li> <li>- Dust suppression measures are implemented according to the mitigation measures.</li> <li>- Burning of waste materials are conducted according to the relevant mitigation measures.</li> </ul> </li> </ul>	CC under DRC's supervision

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ul style="list-style-type: none"> <li>• Avoid impact pile-driving where possible in vibration-sensitive areas. Drilled piles or the use of a sonic or vibratory pile driver causes lower vibration levels where the geological conditions permit their use.</li> <li>• Construction workers exposed to noise levels of 80 dB(A) or more shall be provided with adequate Personal Protective Equipment (PPE) for hearing protection.</li> </ul>		
Waste Management	<p>DRC shall develop <i>Waste Management Plan</i> that will be applicable to all contractors in the project. The Waste Management Plan shall include the following components:</p> <ul style="list-style-type: none"> <li>• Identify classification of waste. The minimum waste classification shall be non-hazardous and hazardous waste;</li> <li>• Identify the size and location of the temporary hazardous waste storage area and non-hazardous waste disposal site for the construction phase of the initial township;</li> <li>• A mechanism for coordination between DRC and CC in waste separation, waste transfer, and record of waste quantity;</li> <li>• Hazardous waste shall include, but not limited to, the following waste materials. Any mixed waste stream that contains any of the hazardous waste shall be categorized as hazardous waste:               <ul style="list-style-type: none"> <li>- Acids and acid waste;</li> <li>- Alkalis and caustic waste;</li> <li>- Batteries;</li> <li>- Spent catalysts, solvents, and chemicals;</li> <li>- Empty containers which held chemicals, paint, oil and solvents;</li> <li>- Oil contaminated waste including oily rags, oil filters, used gloves;</li> <li>- Used oil, hydraulic fluids, chemicals and solvents;</li> <li>- First aid and medical waste;</li> <li>- Spill clean-up waste;</li> <li>- Waste from grease trap and;</li> <li>- Sludge from chemical wastewater treatment system.</li> </ul> </li> <li>• Hazardous waste shall be stored in appropriate temporary hazardous waste storage areas until the permanent hazardous waste management facilities for the operation phase is functional. Minimum requirements of the temporary hazardous waste storage areas include:               <ol style="list-style-type: none"> <li>1. Impervious floor without cracks or spaces that may allow spills to perforate into the ground;</li> <li>2. Surrounded by secondary containment bunds. The secondary containment bunds shall be at least 0.5 m high with a volume large enough to contain the spill of the largest container expected in the storage area;</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>• Monitor every 6 months in construction areas the following issues:               <ul style="list-style-type: none"> <li>- Appropriate containers for type of waste as categorized in the <i>Waste Management Plan</i> are provided for construction work camps, workshops, construction sites and other supporting facilities;</li> <li>- Weekly inspection of waste segregation at the construction facilities and at the hazardous waste storage area and record of hazardous waste inventory;</li> <li>- The location of waste burning area is designated and no waste burning is conducted outside the area.</li> <li>- Inspect waste management training record.</li> </ul> </li> </ul>	<p>DRC to develop <i>Waste Management Plan</i>;</p> <p>CC to implement the plan under DRC's supervision</p>

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ol style="list-style-type: none"> <li>3. Designate storage area for liquids or materials that are not allowed to be mixed, such as acids and alkalis;</li> <li>4. Equipped with spill response kits;</li> <li>5. Consider providing the area with roofing and temporary walls with a provision that the temporary hazardous waste storage area will have to be in use for at least 3 years until the permanent hazardous waste management facilities of the initial township are functional;</li> <li>6. Type and quantity of hazardous waste in the storage area shall be recorded and kept up to date;</li> </ol> <ul style="list-style-type: none"> <li>• Burning of the following non-hazardous waste is allowed: cardboard, pallets, papers, and wood/vegetation waste. The waste burning site shall be designated in the <i>Waste Management Plan</i> and shall be at least 2 km from any villages, construction work camps, or resettlement areas.</li> <li>• Other non-hazardous waste shall be transferred to non-hazardous waste disposal site to be used during construction phase shall meet the following minimum requirements:               <ol style="list-style-type: none"> <li>1. The disposal site shall be on higher ground not subject to flood;</li> <li>2. The disposal site shall be at least 2 km from any groundwater well that is being used by workers or local villagers;</li> <li>3. The disposal site shall be in the area where no excavation is planned. It shall be delineated with clear sign boards;</li> <li>4. The waste shall be covered with soil on daily basis;</li> <li>5. The location of all disposal sites during construction period shall be recorded as expanded appendices to the <i>Waste Management Plan</i>;</li> </ol> </li> <li>• Establish a training program for workers related to waste classification, storage and disposal;</li> <li>• The <i>Waste Management Plan</i> may be expanded to cover recyclable waste and compostable waste in the future.</li> </ul>		

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
On-Site Traffic and Access Management	<ul style="list-style-type: none"> <li>• All access roads in the construction area shall be signposted with information in Myanmar and English;                             <ol style="list-style-type: none"> <li>1. Speed limit</li> <li>2. Construction activities and machinery;</li> <li>3. Roadside borrow pits and material stockpiles;</li> <li>4. Any applicable load limit, particularly for temporary bridges; and</li> <li>5. Road features that may affect driving conditions such as curves, hidden accesses etc.</li> </ol> </li> <li>• A speed limit of 40 km/hr shall be applied in village areas and construction camps. Drivers shall be trained and notified of such limit;</li> <li>• Consider building speed humps before and after each village, where appropriate;</li> <li>• Route for heavy vehicles used for transportation of construction materials shall be designated. Route with least number of villages and residential area is most preferable;</li> <li>• Survey of the access roads to identify blind spots need to be regularly conducted. Improvement to the blind spots such as removal of obstructing objects when necessary; and</li> <li>• Access road used for the construction activities shall be maintained in good conditions.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that relevant mitigation measures implemented in construction area and nearby areas throughout construction phase for all parties.</li> <li>• Ensure that the most appropriate transportation routes were selected to contribute the least impact to locals using the road for their daily travel.</li> </ul>	CC under DRC's supervision
Construction Work Camps	<ul style="list-style-type: none"> <li>• Camp rules shall be established and informed to all residences. The rules should contain the following components:                             <ol style="list-style-type: none"> <li>1. Policy on alcohol and substance abuse;</li> <li>2. Safety measures and emergency response particularly in case of fire;</li> <li>3. Waste management requirements;</li> <li>4. Other measures to prevent dissemination of vectors and transmissible disease including STDs and HIV/AIDs;</li> </ol> </li> <li>• General areas of the camp shall be kept clean and tidy. Waste shall be collected regularly to avoid accumulation of waste in the camp;</li> <li>• Toilets shall be provided at a ratio as 1 toilet per 15 workers. All toilets shall be equipped with septic and seepage tanks of adequate size. The toilets need to be at least 100 meters from any natural waterways. Sludge from tank cleaning shall be stabilized by adding lime (pH = 12 for 30 minutes) and disposed of in designated pit for sludge disposal. The pit shall be at least 1 kilometer from any groundwater wells and is higher than groundwater table;</li> <li>• Proper drainage has to be provided. Improve areas with stagnant water as much as possible and;</li> <li>• Pest control measures shall be planned and implemented. All bedrooms need to be equipped with mosquito protection.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that relevant mitigation measures implemented in construction area throughout construction phase and the camps are periodically inspected.</li> </ul>	CC under DRC's supervision

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
Historical and Cultural Resources	<ul style="list-style-type: none"> <li>• Inform ward/village general administrator if antiques object or ancient monument are found in the project area.</li> <li>• Sites with historical and cultural values shall be identified, recorded and located in the map. This information shall be agreed upon by the local authorities and villagers.</li> <li>• If construction activities have to be carried out within 50 meters from these sites, the leaders of the communities that the sites belong to need to be notified at least 1 week prior to commencement of the activities.</li> <li>• Establish a plan and communication channel in case an unidentified site is encountered during the construction work to avoid damage to the site.</li> <li>• Removal and relocation method and destination shall be a mutual agreement between DRC, local authorities, and the leader of the communities that the site belongs to.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that the records and maps are kept and up to date and available to all parties.</li> <li>• Locations subjected to be disturbed by the construction have been informed or notified about construction progress.</li> </ul>	CC under DRC's supervision
Risk Assessment	<p>Require the ITD contractor to:</p> <ul style="list-style-type: none"> <li>• Prepare a Construction Phase Environmental Management Plan (CEMP) base on the EIA report and associated CEMP, detailed design and construction plan and schedule. The CEMP must clear define:                             <ol style="list-style-type: none"> <li>1. The project's environmental requirements and obligation;</li> <li>2. Physical measures that are needed to comply with the requirements and obligation;</li> <li>3. Construction measures that are needed to comply with the requirements and obligation and;</li> <li>4. Assignment of responsibilities to each subcontractor.</li> </ol> </li> <li>• TOR for procurement of the ITD contract must clearly state the project's environmental requirements during the construction phase that the ITD contractor must ensure that the project construction will meet the requirements;</li> <li>• The ITD contract must clearly prescribes environmental management responsibility of the ITD contractor;</li> <li>• The supervision consultant will be required to submit a supervision and monitoring plan that clearly indicates the environmental tasks to be supervised and monitored. This supervision and monitoring plan for the implementation of the environmental mitigation measures;</li> <li>• Monthly reviews of the ITD contractor environmental performance;</li> <li>• Close supervision of truck operations especially during the site filling period;</li> <li>• Changes in designs or construction methods may be initiated by the ITD contractor or the project proponent. The request for changes must be subject to the change procedure in project management. The request for changes must be accommodated by an analysis of environmental implications and revised mitigation measures and;</li> </ul>		CC under DRC's supervision

Communicate potential accidents and/or hazards to local authorities, communities and relevant parties;</li> <li>3. Conduct emergency response practices/training with local response organizations and local responders and;</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that relevant mitigation measures are implemented.</li> </ul>	CC under DRC's supervision

**Table 1.3-2 Mitigation Measures and Monitoring Program During Construction Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ol style="list-style-type: none"> <li>4. Revise or/and establish Emergency Response Plans as necessary according to changing of environmental situation including notify the Minister and Dawei Special Economic Zone Management Committee.</li> </ol> <ul style="list-style-type: none"> <li>• Adequacy and Readiness of Healthcare Services:                             <ol style="list-style-type: none"> <li>1. Provide the first aid unit at the camp site for their workers, assess whether the local health service capacity sufficient for worker's family and supporting industries, and in close collaborating with local authorities, consider supporting additional health service facility.</li> <li>2. Risk and impact to environment from construction of Health Centre Services i.e. hospital shall be assessed including establishment of environmental management plan and mitigation measures.</li> </ol> </li> </ul>		
Public Participation and Dissemination	<ul style="list-style-type: none"> <li>• Establish <i>Public Relation and Public Participation Plan</i> to incorporate in requests and recommendation of the continuous engagement of stakeholders following:                             <ol style="list-style-type: none"> <li>1. Inform about project activities to community</li> <li>2. Support nearby community as appropriate to build good relationship with community</li> <li>3. Communicate to build community understanding about                                     <ul style="list-style-type: none"> <li>- Construction activities and progress</li> <li>- Potential environmental impacts and mitigation measures</li> </ul> </li> <li>4. Conduct by DRC consistent with the applicable standard for public meeting/consultation</li> <li>5. Disclose about project information and public relation activities through channels such as website, e-mails, meeting/visiting and local exhibition board or local media.</li> <li>6. Take account the results of the public consultation in improving and revised the EMPs</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>• Monitor 1 time for entire construction phase using questionnaire for communities within 1 km of the Project area.</li> </ul>	DRC
Grievances Redress	<ul style="list-style-type: none"> <li>• Establish <i>Grievance Redress Procedure</i> to address any complaints/grievances to resolve/settle disputes that brought forward by community pertaining to project activities.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that complaints/grievances are recorded and cases are settled.</li> </ul>	DRC

Remarks: MC: Management Committee  
 DRC: Dawei Residence Company Limited  
 CC: Construction Contractors

**Table 1.3-3 Mitigation Measures and Monitoring Program During Operation Phase For Initial Township Project**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
Environmental Policy, Rules, and	<p>DRC as the project owner has to establish the Environmental Policy and Rules for Initial Township based on the following principles:</p> <ul style="list-style-type: none"> <li>• Eco city concept which have the following key components:                             <ol style="list-style-type: none"> <li>1. Integration with natural system;</li> <li>2. Maximize energy efficiency through facility design and other means;</li> <li>3. Material flow through the whole area and ensure maximum reuse and recycling and;</li> <li>4. Water conservation, reuse, and recycling in the Initial Township.</li> </ol> </li> <li>• Prepare <i>Environmental, Health and Safety Plan</i> or <i>EHS Management Plan</i> or programs should also be reassessed periodically to ensure that the key environmental health and safety risks are determined in accordance with changes in order that the potential risks will be appropriately addressed. Thus, EHS system and performance should be improved continuously by a combination of ongoing monitoring of the Initial Township and high performances as well as effective accountability of the facility and;</li> <li>• Establish <i>Environmental Rules</i> that the township has to follow. These rules will be in accordance with the EMP for operation period. The rules will be attached with the contractual document between the contractor, operator and DRC.</li> </ul>		DRC
Overall Roles and Responsibilities of Project Owner	<p>DRC has to establish a strong organization to handle the dynamic and changes that will occur during the operation phase of the project, and should consider the following measures:</p> <ul style="list-style-type: none"> <li>• DRC should establish a sector responsible for safety health and environmental management of the Initial Township to prepare and perform the environmental management plan and programs to ensure that the Initial Township comply with environmental legislation and other relevant safety health and environmental requirements, and to achieve the most up-to-date environmental protection requirements: measures, standards;</li> <li>• DRC should periodically assess/reassess the environmental management plan or programs to ensure that the key environmental health and safety risks are evaluate and;</li> <li>• Due to the long period of the Initial Township project, DRC should ensure that EHS performance will be improved continuously via a combination of ongoing monitoring program and cooperation with the residences and community mall inside the Initial Township;</li> </ul>		DRC

**Table 1.3 -3 Mitigation Measures and Monitoring Program During Operation Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ul style="list-style-type: none"> <li>• DRC needs to prepare and commission a database system to keep track of and analyze environmental data, flow of materials and waste, water consumption, wastewater generation rate and quality, and energy consumption. The data base will help organize the data from monitoring program of DRC and of the township, and can also be used as a tool to promote conservation of material, energy, and water among the industries, if the database is designed properly and;</li> <li>• DRC should provide provisions to ensure that the project can apply proper environmental health and safety management to protect health and safety of workers and the public.</li> </ul>		
Air Emission and Noise Control	<ul style="list-style-type: none"> <li>• Provide some space areas for tree planting within the project area.</li> <li>• Care and maintain the trees planted; in case the trees are dead, shall plant trees to replace the dead ones.</li> <li>• Install sign to notice that <i>“Do not start the car while parking for waiting”</i> at the parking area and reiterate the security guards to control strictly including in Myanmar language.</li> <li>• Limit vehicle speed inside township area as 30 km/hr to mitigate possible noise impacts on nearby area.</li> <li>• Install the <i>“No Audible”</i> sign within residential and township areas in obvious places.</li> <li>• Plan for emission of GHGs from the Project shall be established and/or revised in concurrently with the relevant policy and regulations.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that relevant mitigation measures are implemented and been reported to MC every 6 months.</li> </ul>	DRC or MC's Authorized Agency
Waste Management	<ul style="list-style-type: none"> <li>• Design and construction of the landfill shall be in accordance with <i>Solid Waste Disposal Facility Criteria</i> - Technical Manual published by U.S. EPA (1993) or other applicable standards.</li> <li>• Detailed hydrogeological condition of the proposed landfill area has to be studied in the design of landfill.</li> <li>• Groundwater monitoring wells will be installed. As a minimum, 1 well is to be installed up-gradient of the landfill and at least 3 wells is to be installed down-gradient of the landfill. Depth of screens and well construction depends on the results from the hydrogeological condition study.</li> <li>• The components of the waste management facility i.e. sanitary landfill, secured landfill and incinerator shall be designed and constructed according to the internationally accepted standards.</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor groundwater very month for the first 6 months and then every 6 months unless unusual concentration are observed and compared the results with Thailand's groundwater quality standards or other applicable international standards following:                             <ul style="list-style-type: none"> <li>- Collect baseline groundwater quality before the operation of the landfill.</li> <li>- For where the hazardous waste stabilization and disposal are conducted, monitor the following parameters: pH, redox potential, dissolved oxygen, temperature</li> </ul> </li> </ul>	DRC or MC's Authorized Agency

**Table 1.3-3 Mitigation Measures and Monitoring Program During Operation Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ul style="list-style-type: none"> <li>• The facility shall create its <i>Standard Operating Procedure</i> covering steps from receiving waste, laboratory analysis, stabilization, temporary storage, incineration and disposal. Audit by third party is necessary.</li> <li>• The landfill shall be closed daily to prevent vectors and odors.</li> <li>• Classify hazardous and non-hazardous waste according to the definitions in the Waste Management Plan prepared.</li> <li>• Workers need to be trained of <i>Waste Management Plan</i>.</li> <li>• All hazardous and non-hazardous waste generated shall be transferred to the facility for disposal.</li> <li>• Waste manifest system has to be created and implemented.</li> <li>• Record of type of waste including its quality shall be kept in the database of DRC.</li> <li>• Waste Management Facility (if constructed in landfill).</li> </ul>	<p>conductivity, turbidity and metals; Cd, Cu, Pb, Mn, Ni, As, Se and Hg.</p> <ul style="list-style-type: none"> <li>• Monitor every 6 months runoff and wastewater.</li> </ul>	<p>DRC or MC-s Authorized Agency</p>
Water and Sediment Quality	<ul style="list-style-type: none"> <li>• Prepare and implement the measures for <i>Waste Management</i> and <i>Wastewater Management</i>.</li> <li>• The discharged of untreated wastewater into the receiving water is strictly prohibited at all time. Wastewater must be treated and comply with NEQG standard before discharge into natural drainage.</li> <li>• Wastewater from the initial township operation shall be reused to water the trees planted in the initial township.</li> <li>• <i>Emergency plan for operation of wastewater treatment</i> should be established to prevent untreated effluent discharged into the receiving water.</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor 3 times (dry, early wet and end of wet season) per year surface water and sediment with parameters as prescribed in Table 8.3-1:                             <ul style="list-style-type: none"> <li>- For full phase: 6 sampling stations with parameters as in Figure 8.3-1.</li> <li>- For 9-1 phase: 2 sampling stations (TS-SW2 and TS-SW3).</li> </ul> </li> </ul>	<p>DRC or MC-s Authorized Agency</p>
Terrestrial Ecology	<ul style="list-style-type: none"> <li>• Wherever possible, conserve the existing trees, particularly in the green areas,</li> <li>• Coordinate with local authorities and engage local communities for reforestation projects surrounding the project area.</li> <li>• Discourage and educate the workers towards wildlife consumption to reduce demand and indirect impacts to the wildlife in reserved forests elsewhere outside the project area.</li> </ul>		<p>DRC or MC-s Authorized Agency</p>
Land Use, Township, and Community Management	<ul style="list-style-type: none"> <li>• Special Plan and Buffer Zone:                             <ol style="list-style-type: none"> <li>1. A special specific area plan, legitimate and authorized by the state, is needed to control the land use adjacent to the project estate;</li> <li>2. A clear and marked buffer zone all around the township boundary should be set up to control and prevent any uses other than agriculture and forest;</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that mitigation measures and land use plan are implemented and in long-term communities located in safe distance from the initial township and conflicts were reduced.</li> </ul>	<p>DRC or MC-s Authorized Agency</p>

**Table 1.3-3 Mitigation Measures and Monitoring Program During Operation Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ul style="list-style-type: none"> <li>3. The size of the buffer zone should be determined by land use expert to ensure that in case of fire or other hazards, only a minimum number of people will be affected and rescue and relocation efforts will be with ease and;</li> <li>4. A comprehensive plan authorized by the state for the future of Dawei is needed for appropriate growth.</li> <li>• A Management Committee Overseeing the Project Land Use.                             <ul style="list-style-type: none"> <li>1. A team or committee should be set up to monitor and manage activities and structures built in and around the project area.</li> <li>2. The team should have legitimate authority to control the areas adjacent or nearby, though outside the township boundary.</li> <li>3. Squatters must be notified that they are only allowed to operate temporarily and must be relocated when the time comes in order to prevent scattered temporary structures from evolving into unsuitable permanent settlements outside the initial area.</li> </ul> </li> <li>• Transportation and Infrastructure outside the Estate Area.                             <ul style="list-style-type: none"> <li>1. For the area immediately outside the township and other infrastructures that will enable setting up structures and services, such as, local roads, electricity, water supply, and drainage, should be also well planned and controlled.</li> <li>2. The strategic locating or prohibiting of these basic infrastructures will be needed to induce and encourage early settlers and services outside designated township zone into the planned area.</li> </ul> </li> <li>• Enforcement:                             <ul style="list-style-type: none"> <li>1. The proposed set-up land use management committee/team should have duty to regularly monitor land use activities outside and inside the township area as the development progresses.</li> <li>2. Co-operation with local or state authority is needed to be able to control, direct, or enforce private buildings outside the project boundaries to prevent unsuitable and obstructing growth nearby the project area.</li> </ul> </li> </ul>		
Occupational Health and Safety	<ul style="list-style-type: none"> <li>• Accidents and Injuries:                             <ul style="list-style-type: none"> <li>1. Provide the environmental health and safety management system and programs for the whole initial township.</li> <li>2. Establish occupational health and safety management plans and programs to assess and manage EHS impacts and risks which are based on comprehensive job safety analyses.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that occupational health and safety statistics and records were monthly update.</li> </ul>	DRC

**Table 1.3-3 Mitigation Measures and Monitoring Program During Operation Phase For Initial Township Project (Cont.)**

Management Issue	Mitigation Measure	Monitoring Program	Responsibilities
	<ul style="list-style-type: none"> <li>3. Include the following issues in the occupational health and safety management system:                             <ul style="list-style-type: none"> <li>- Accident investigation, recording and reporting</li> <li>- Surveillance of the employee's health</li> <li>- Training and hazard communication</li> <li>- Monitoring and auditing procedures to evaluate the effectiveness of prevention and control measures.</li> </ul> </li> <li>4. Perform occupational accidents and disease recording and reporting, investigate all incidents to understand the cause of accident and to identify measures necessary to prevent a recurrence.</li> <li>5. Provide area signage and labeling of equipment in accordance with international standards and easily to understand by employees, visitors and general public.</li> <li>6. Promote traffic safety programs to all personnel, for example;                             <ul style="list-style-type: none"> <li>- Improving driving skill</li> <li>- Use of speed control devices</li> </ul> </li> <li>• Occupational, Sexual Transmission and Communicable Diseases:                             <ul style="list-style-type: none"> <li>1. Conduct surveillance and active screening and treatment of employees. Immunization program may be required.</li> <li>2. Provide training programs for employees in these following topics: health awareness, and promote health protection strategies including encouraging condom use.</li> <li>3. Perform periodic employee's health checks in accordance with the potential risks.</li> </ul> </li> <li>• Fire and Other Hazards                             <ul style="list-style-type: none"> <li>1. Provide comprehensive emergency preparedness and response plan and procedures covering fire and other hazards control.</li> <li>2. Provide appropriate emergency services and personnel to execute emergency response when needed, and maintain equipment facilities, fire-fighting equipment in good working order, accessible and adequate for the dimension and the basis use.</li> <li>3. Establish appropriate fire safety system to ensure its capability to cope with all the potential hazards.</li> <li>4. Conduct annual training and updating emergency preparedness and response plan to account for changes in equipment, personnel and facilities.</li> </ul> </li> <li>• Adequacy and Readiness of Healthcare Services:</li> </ul>	<ul style="list-style-type: none"> <li>• Monitor performance of health and safety operation against a set benchmark</li> <li>• Inspect periodically health and safety conditions.</li> <li>• Ensure implementation of the following:                             <ul style="list-style-type: none"> <li>- Emergency equipment and facilities in response to fire, natural disasters and accidents are available and well maintenance.</li> <li>- Emergency response plan is appropriate to changes of the environmental condition such fire situation and natural disasters.</li> </ul> </li> <li>• Revised Emergency Responses Plan are submitted to relevant agencies.</li> </ul>	<p>DDC or MC's Authorized Agency</p>

## **1.4 BUDGET FOR ENVIRONMENTAL MANAGEMENT AND MONITORING**

This section describes the budget plans for the environmental management and environmental monitoring by the Project Proponent. Most of the environmental management cost and mitigation measures such as construction of retention ponds, polishing ponds, are already included in the project cost.

In terms of the budget for environmental monitoring before/during construction and operation phases, main monitoring cost is a cost for field measurements such as air quality, water, and quality noise. Annual costs for field measurements in the construction phase by contractor and in the operation phase by the Project Proponent are estimated in Table 1.4-1 and Table 1.4-2.

**Table 1.4-1 Environmental Management Plan (EMP) – Proposed Monitoring Measures for Construction Phase**

	Positions	Number	Estimated Budgets/Year (USD)		
<b>Staff</b>	1. Environmental Health and Safety (EHS) Manager	1	55,200		
	2. Environmental Supervisor	1	30,000		
	- Staff	3	64,800		
	3. Health and Safety Supervisor	1	37,200		
	- Staff	2	43,200		
<b>Total Staff Estimated Budgets/Year</b>			230,400		
Attribute	Inspection Issues and Monitoring Parameters	Location	Frequency	Responsibilities	Estimated Budgets (USD)
Erosion and Sedimentation Control	<u>Issues:</u> 1. Erosion and sediment controls are in place prior to wet season; 2. The drainage system and sediment controls are functional during wet season; 3. The sediment basins have a capacity of reducing the suspended solid from storm water by fifty percent (50%)	Construction area	Every 6 months	DRC or Third party consultant	
	<u>Parameter:</u> Total Suspended Solid	upstream and downstream of the entry points of surface water runoff from each construction area	As indicated in the Erosion and Sediment Control Plan	DRC or Third party consultant	50 ,construction area
Surface Water and Sediment Quality	<u>Parameters:</u> All parameters and analysis methods of as indicated in	Full Phase ,6 Sampling stations as shown in and 9+1 Phase ,2 Sampling stations (TS-SW02 and 03)	Every 6 months before and after rainy season, through the construction period or at least for 3 years	DRC or Third party consultant	36,000/year 12,000/year
Terrestrial Biology	<u>Issues:</u> Progress of construction work and vegetation clearing	Construction area,natural forests and mangrove areas	Every 6 months	DRC or Third party consultant

Attribute	Inspection Issues and Monitoring Parameters	Location	Frequency	Responsibilities	Estimated Budgets (USD)
Waste Management Facility (if constructed in the landfill)	<u>Parameters:</u> 1. Baseline groundwater quality before the operation of the landfill. Parameters when hazardous waste stabilization and disposal is conducted: pH, redox potential, dissolved oxygen, temperature, conductivity, turbidity and metals (cadmium, copper, lead, manganese, nickel, arsenic, selenium, and mercury).	Designated monitoring well	Every month for the first 6 months and then every 6 months unless unusual concentrations are observed.	DRC or Third party consultant	2,300/year
Surface Water and Sediment Quality	<u>Parameters:</u> Surface water and sediment, as shown in	Full Phase ,Total of 6 sampling stations, as described in <b>and Figure 8.4-1</b>  9+1 Phase ,2 Sampling stations (TS-SW02 and 03)	At least thrice a year (dry, early wet and end of wet season).	DRC or Third party consultant	30,000/year  10,000/year
Public and Occupational Health	Keep monthly update of health and safety statistics and records.	Township area	Every month	DRC or Third party consultant	
Report Preparation (10 sets)			Every 6 months	DRC or Third party consultant	11,700/year

MC: Management Committee DRC: Dawei Residence Company Limited CC: Construction Contractors

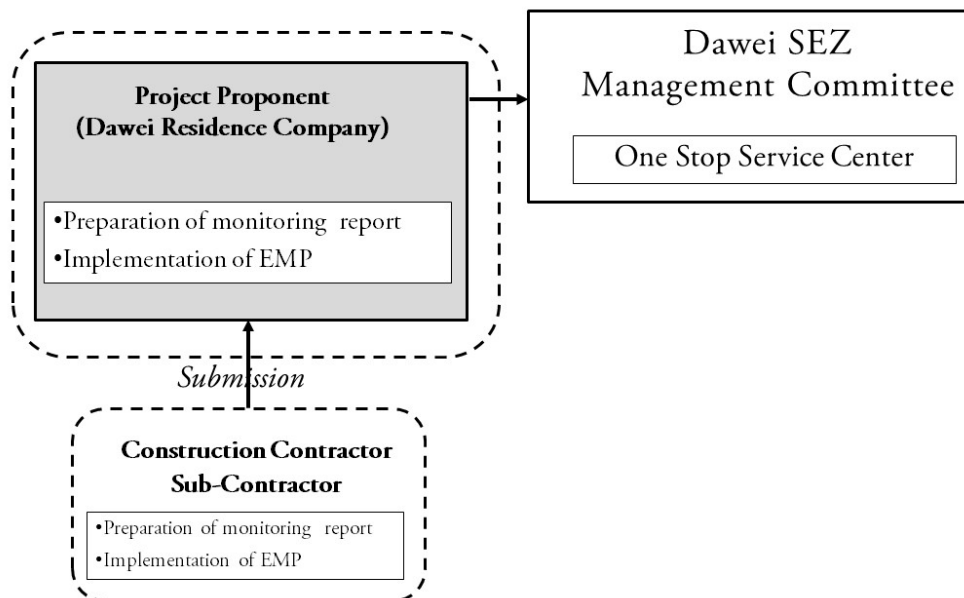

## 1.5 IMPLEMENTATION SCHEDULE

The implementation schedule as of May 2017 of the pre-construction, construction, and operation phases of the Initial Township project is as follows:

- 1) Pre-construction period : from 2017 to get approval of ESIA and land lease agreement
- 2) Construction period: 24 months after get approval of ESIA and land lease agreement, depend on demand basis of residence.
- 3) Operation period: 75 years (Maximum)

## 1.6 INSTITUTIONAL ARRANGEMENT

The organization structure for the operation and management of environmental monitoring is shown in **Figure 1.6-1**.

Source: EIA Study Team

**Figure 1.6-1 Organization structure for EMP and EMoP of the Project during operation phase**

### 1.6.1 Governing Bodies

According to the Myanmar Special Economic Zone Law (2011), there are 3 levels of government agencies directly associated with DRC

- Central Body
- Central Working Body
- Management Committee

The Central Body (CB) consists of members from ministries and government departments as assigned by the Government of Myanmar. CB is a policy making level among the three organizations. The duties of CB include reviewing proposals for development of a Special Economic Zone, determining type business, and other financial and taxes related matter. It reports to the Government of Myanmar. The Central Body is responsible to forming and assigning detailed duties to the Central Working Body (CWB) and Management Committee (MC).

CWB assists CB in reviewing the Special Economic Zone plan, determining of appropriate category of investment, and advising CB on matters regarding administration, management and legal issues in the Special Economic Zone. CWB reports to CB.

MC is the implementation mechanism of the governing bodies. One of the key duties of MC is supervising and inspecting the matters on implementation of investment plans and other matters including land use, environmental conservation, waste control, health, education, finance and taxation, transport, communication, security, electricity, energy and water supply etc. MC reports to both CB and CWB.

### 1.6.2 Project Proponent

The Project Proponent will be in charge of the overall operation of the initial township during the construction and operation. The Project Proponent will implement, EMP and EMoP as stated in this EIA report and almost by through construction contractors and sub-contractors.

Main tasks for environmental and social consideration in the Project are managed by Environment, Safety and Health section and / or Community relation division in Table 1.6-1.

**Table 1.6-1 Main Tasks for Environmental and Social Consideration in the Initial Township**

Division/Section	Main Tasks
Environment, Safety and Health section	<ol style="list-style-type: none"> <li>1) Monitoring the DSEZ Initial Industrial Estate area operations according to EMP and EMoP</li> <li>2) Submitting environmental monitoring reports to DSEZMC</li> </ol>
Community relation division	<ol style="list-style-type: none"> <li>1) Grievance Adjustment <ul style="list-style-type: none"> <li>- Handling complains/ claims/ requests from community and its response as necessary</li> <li>- Coordinating between tenant and community for grievance adjustment</li> </ul> </li> <li>2) Planning and implementation of CSR activities</li> </ol>

Source: EIA Study Team

### 1.6.3 Construction Contractor and sub-contractors

Construction Contractors (CC) refer to the contractors for the development of Initial Township, which include constructions of utility systems (i.e. water treatment and distribution system, wastewater collection and treatment system, irrigation system, electricity generation

and distribution system, solid and hazardous waste management facilities etc.), internal roads, and basic infrastructure for the Complex.

CC must operate in accordance with the mitigation measures stipulated in this EIA report. CC report to the Project Owner.

Responsibilities of CC during construction phase include:

- Implement environmental mitigation measures for the construction activities and work camps as required by DRC;
- Liaise and coordinate with DRC on matters related to environment and public consultation; and
- Develop emergency response plan and establish emergency response capability for construction phase, which may include accidents, fire and first aid and medical evacuation.

## **1.7 PROJECT POLICY**

### **1.7.1 Policy**

The Project Proponent refers to Dawei Residence Company Limited (DRC), which falls under the category of 'Developer' according to Myanmar Special Economic Zone Law (2011). DRC roles in the project include design, construction, and operation of infrastructure and amenities in the Initial Township. DRC will be responsible for technical planning, enforcing, and monitoring of all environmental mitigation measures as stipulated in the EMP. The Project Owner reports to the Governing Body.

#### **1.7.1.1 Construction Phase**

Responsibilities of DRC prior to and during construction phase include:

- Hold discussions with the government agencies to develop procedure for inter-agency coordination and reporting;
- Ensure that provision of relevant environmental mitigation measures are reflected in the contract between DRC and construction contractors;
- Develop monitoring programs and monitor the implementation of environmental mitigation measures for construction period; and
- Liaise and coordinate with government agencies on the matters related to environment and public consultation.

#### **1.7.1.2 Operation Phase**

Responsibilities of DRC during operation phase include:

- Establish environmental requirements for the industrial estate following the mitigation measures for the operation phase;
- Distribute the environmental requirements to the factories/manufacturers and ensure that the factories/manufacturers comply with the environmental requirements both during construction and operation of the facilities;
- Operate the utility systems of the industrial estate including electricity generation, water treatment and distribution, solid and hazardous waste management, and wastewater treatment system;
- Develop emergency response plan and establish emergency response capability for operating phase, which may include traffic accidents, fire and chemical pollution incidents within the industrial estate area;
- Develop monitoring programs and monitor the implementation of environmental mitigation measures for operating phase; and
- Liaise and coordinate with government agencies on the matters related to environment and public consultation.

### 1.7.2 Environmental Management System

DRC as the project owner has to establish the environmental policy and rules that will govern environmental practices and performance of the Initial Township as a whole. The establishment and implementation of this component is of utmost important due to absence of local environmental regulations and authorities fully responsible for environment and pollution control in Myanmar. Once established, DRC shall adhere to these policy and rules. However, in the future, when the environmental protection laws may be announced and published by the Government of Myanmar, DRC shall ensure that the requirements as set in the policy and rules are fully in compliance with the laws.

Environmental policy and rules for Initial Township shall be based on the following principles:

- Eco city concept which have the following key components:
  - Integration with natural system.
  - Maximize energy efficiency through facility design and other means.
  - Material flow through the whole area and ensure maximum reuse and recycling.
  - Water conservation, reuse and recycling in the Initial Township.
- Prepare Environmental, Health and Safety Plan. EHS management plan or programs should also be reassessed periodically to ensure that the key environmental health and safety risks are determined in accordance with changes in order that the potential risks will be appropriately addressed. Thus, EHS system and performance should be improved continuously by a combination of ongoing monitoring of the Initial Township and high performances as well as effective accountability of the facility

- Establish *Environmental Rules* that the township has to follow. These rules will be in accordance with the EMP for operation period. The rules will be attached with the contractual document between the contractor, operator and DRC.

In addition to the above policy and rules, DRC will play a leading role in maintaining and improving overall environmental performance of the whole Initial Township. The EIA was prepared in a broad scope to cover all possible activities in the Initial Township in high level. DRC will have to establish a strong organization to handle the dynamic and changes that will occur during the construction and operation of the project. To achieve environmental safety and health management goals, to protect the environment, workers and the public from any adverse impacts caused by the project, the strong environmental management commitments and the proficient mitigation measures are needed. In order to develop the comprehensive environmental management plan, DRC as the project owner should be aware of the change during the operation period, and should consider the following measures.

- DRC should establish a sector responsible for safety health and environmental management of the Initial Township to prepare and perform the environmental management plan and programs to ensure that the Initial Township comply with environmental legislation and other relevant safety health and environmental requirements, and to achieve the most up-to-date environmental protection requirements/ measures/ standards.
- DRC should periodically assess/reassess the environmental management plan or programs to ensure that the key environmental health and safety risks are evaluate.
- Due to the long period of the Initial Township Project, DRC should ensure that EHS performance will be improved continuously via a combination of ongoing monitoring program and cooperation with the residences and community mall inside the Initial Township.
- DRC needs to prepare and commission a database system to keep track of and analyze environmental data, flow of materials and waste, water consumption, wastewater generation rate and quality, and energy consumption. The database will help organize the data from monitoring program of DRC and of the township, and can also be used as a tool to promote conservation of material, energy, and water among the township, if the database is designed properly.
- DRC should provide provisions to ensure that the project can apply proper environmental health and safety management to protect health and safety of workers and the public.

### **1.7.3 Mitigation Measures Commitments**

The Project commits to comply with all mitigation measures as stated in the Environmental Management Action Plans during construction phase and operation phase.
